## EXECUTIVE SUMMARY

This report documents the climatic and hydrologic data collection in 2000 by Golder Associates as part of the Oil Sands Regional Aquatics Monitoring Program (RAMP). RAMP is a long-term monitoring program in the Oil Sands Region of northeastern Alberta currently jointly funded and commissioned by Syncrude, Albion, Mobil, Suncor, TrueNorth and Petro-Canada.

The 2000 program included climatic monitoring, hydrologic monitoring, a snow course survey, installation and maintenance of station equipment, and data processing and compilation.

Climatic monitoring at the Aurora Climate Station included hourly, daily and monthly data for rainfall, snowfall, air temperatures, relative humidity, solar radiation, and wind speeds and directions. Operation and maintenance included periodic site visits, inspection of monitoring equipment, some equipment improvements and exchange of the data storage module.

Hydrologic monitoring included the collection of streamflow, high water mark, lake level and total suspended solids data. Specifically, the 2000 program included the following:

- manual flow measurements, stage-discharge rating curves, and derived hourly and daily discharges at the streamflow monitoring stations including McClelland Lake Outlet (L1), Alsands Drain (S1), Jackpine Creek (S2), Muskeg River Aurora (S5A), Mills Creek (S6), Muskeg River WSC (S7), Poplar Creek (S11), Fort Creek (S12) and Albion Pond #3 (S13);
- measurements of high water marks from the flood event in late June 2000 at five staff gauges on the Muskeg River;
- hourly and daily water level measurements at the Stanley Creek (S8), McClelland Lake (L1), Kearn Lake (L2) and Isadore's Lake (L3) stations; and
- total suspended solids (TSS) sampling at streamflow and lake monitoring stations.

This report documents the work associated with installation of new water level monitoring stations on Fort Creek (S12) and Albion Pond #3 (S13). Iyinimin Creek (S3), Blackfly Creek (S4), Kearn Lake Outlet (S9) and Wapasu Creek (S10) were not monitored in 2000.

The snow course survey conducted on March 12, 2000 provided data to determine the average accumulated snow depth for the watershed and snow redistribution in five representative terrain types. The 2000 program was a continuation of a five-year program that began in 1997. The results will be used to correct snowfall data recorded at the Aurora Climate Station, and to calibrate and verify the regional hydrologic model.

The 2000 program has resulted in development of a regional climatic and hydrologic database updated to the end of 2000. This database is stored on a compact disc for easy access by users.

It is recommended that the collection of climatic and hydrologic data at the existing monitoring stations be continued and that monitoring should cover the entire year including winter low flows, snowmelt and summer flows. Specific recommendations for the 2001 monitoring program include ongoing operation and maintenance of the climatic and hydrologic monitoring stations, a snow course survey for the 00/01 winter and ongoing monitoring of high water marks.

## 1 INTRODUCTION

This report presents the methodology and data collected in the 2000 climatic and hydrologic monitoring program. This program is part of the Oil Sands Regional Aquatics Monitoring Program (RAMP), an integrated multi-disciplinary aquatic monitoring program in the Oil Sands Region of northeastern Alberta. Syncrude Canada Ltd. (Syncrude), Albian Sands Energy Inc. (Albian), ExxonMobil (Mobil), Suncor Energy Inc. (Suncor), TrueNorth Energy (TrueNorth) and Petro-Canada Oil and Gas Ltd. (Petro-Canada) provided joint funding for commissioning Golder Associates Ltd. (Golder) to conduct the 2000 monitoring program. The objectives of this monitoring program were the following:

- to undertake climatic and hydrologic monitoring required by Alberta Environment in the regulatory approvals for the Syncrude Aurora and Albian Muskeg River Mine projects;
- to undertake climatic and hydrologic monitoring recommended in the environmental impact assessments (EIA's) for the Syncrude Aurora and Albian Muskeg River Mine projects;
- to undertake baseline hydrologic monitoring for the TrueNorth Fort Hills Project EIA; and
- to expand the climatic and hydrologic database required for operational and reclamation water management planning and design of the existing and future oil sands developments in the region by Syncrude, Albian, Mobil, Suncor, TrueNorth and Petro-Canada.

The 2000 program focused on climatic and hydrologic monitoring in the Muskeg River basin. The program also included hydrologic monitoring for Mills Creek, Fort Creek, Poplar Creek, McClelland Lake and Isadore's Lake, all of which are located outside the Muskeg River basin. The 2000 program design was based on the current regulatory monitoring requirements, the long-term need for expanding the regional climatic and hydrologic database, and a thorough understanding of the historic database developed to date.

The Meteorological Service of Canada (MSC) and the Water Survey of Canada (WSC) operate long-term climatic and hydrologic monitoring networks in the Fort McMurray region. For the existing oil sands operations west of the Athabasca River, Syncrude and Suncor have installed a number of local monitoring stations that include the Mildred Lake Climate Station currently operated by MSC. In the Muskeg River basin, climatic and hydrologic monitoring initiated by oil sands developers include the following:

- **Alsands Baseline Data Collection Program (1979)**

This program resulted in the collection of miscellaneous streamflow data between 1980 and 1983, and one year of climatic data at the Alsands study area.

- **OSLO Baseline Data Collection Program (1989)**

This program resulted in collection of two years of streamflow data on five small streams in the OSLO study area and one year of climatic data in 1988 at the abandoned OSLO airstrip located by Jackpine Creek.

- **Aurora Mine Development (1995 and 1996)**

In 1995 and 1996, Syncrude collected data at five streamflow monitoring stations on the Alsands Drain, Jackpine Creek, Iyinimin Creek, Blackfly Creek and the Muskeg River. In addition, Syncrude installed the Aurora Climate Station at the abandoned OSLO airstrip in May 1995.

- **Monitoring Program by Syncrude and Shell (1997)**

Syncrude and Shell (Albian) provided joint funding for the 1997 monitoring program in the Muskeg River basin and surrounding areas. The program expanded in scope to include hydrologic monitoring on Mills Creek and a snow course survey. The hydrologic monitoring on McClelland Lake and Poplar Creek outside the Muskeg River basin was also included in the program.

- **Monitoring Program by Syncrude, Shell, Mobil and Suncor (1998 and 1999)**

Syncrude, Shell (Albian), Mobil and Suncor provided joint funding for the 1998 monitoring program in the Muskeg River basin and surrounding areas. The program expanded in scope to include hydrologic monitoring on the Kearl Lake outlet. The hydrologic monitoring on McClelland Lake, Mills Creek and Poplar Creek outside the Muskeg River basin was included in the program, and the snow course survey program initiated in 1997 was continued. Hydrologic monitoring on Blackfly Creek was suspended in 1999.

- **Regional Aquatics Monitoring Program – Climate and Hydrology (2000)**

In 2000, climatic and hydrologic monitoring in the Muskeg River basin and surrounding areas was integrated into the Regional Aquatics Monitoring Program (RAMP). Continued funding was provided by

Syncrude, Albian, Mobil and Suncor, while TrueNorth and Petro-Canada joined the program as funders. The program expanded in scope to include hydrologic monitoring on Fort Creek and Albian Pond #3, and the snow course survey program initiated in 1997 was continued. The hydrologic monitoring on Iyinimin Creek, Kearn Lake Outlet and Wapasu Creek were suspended in 2000.

In accordance with the draft rationale document prepared by Golder in May 2000, the scope of work for the 2000 monitoring program included the following:

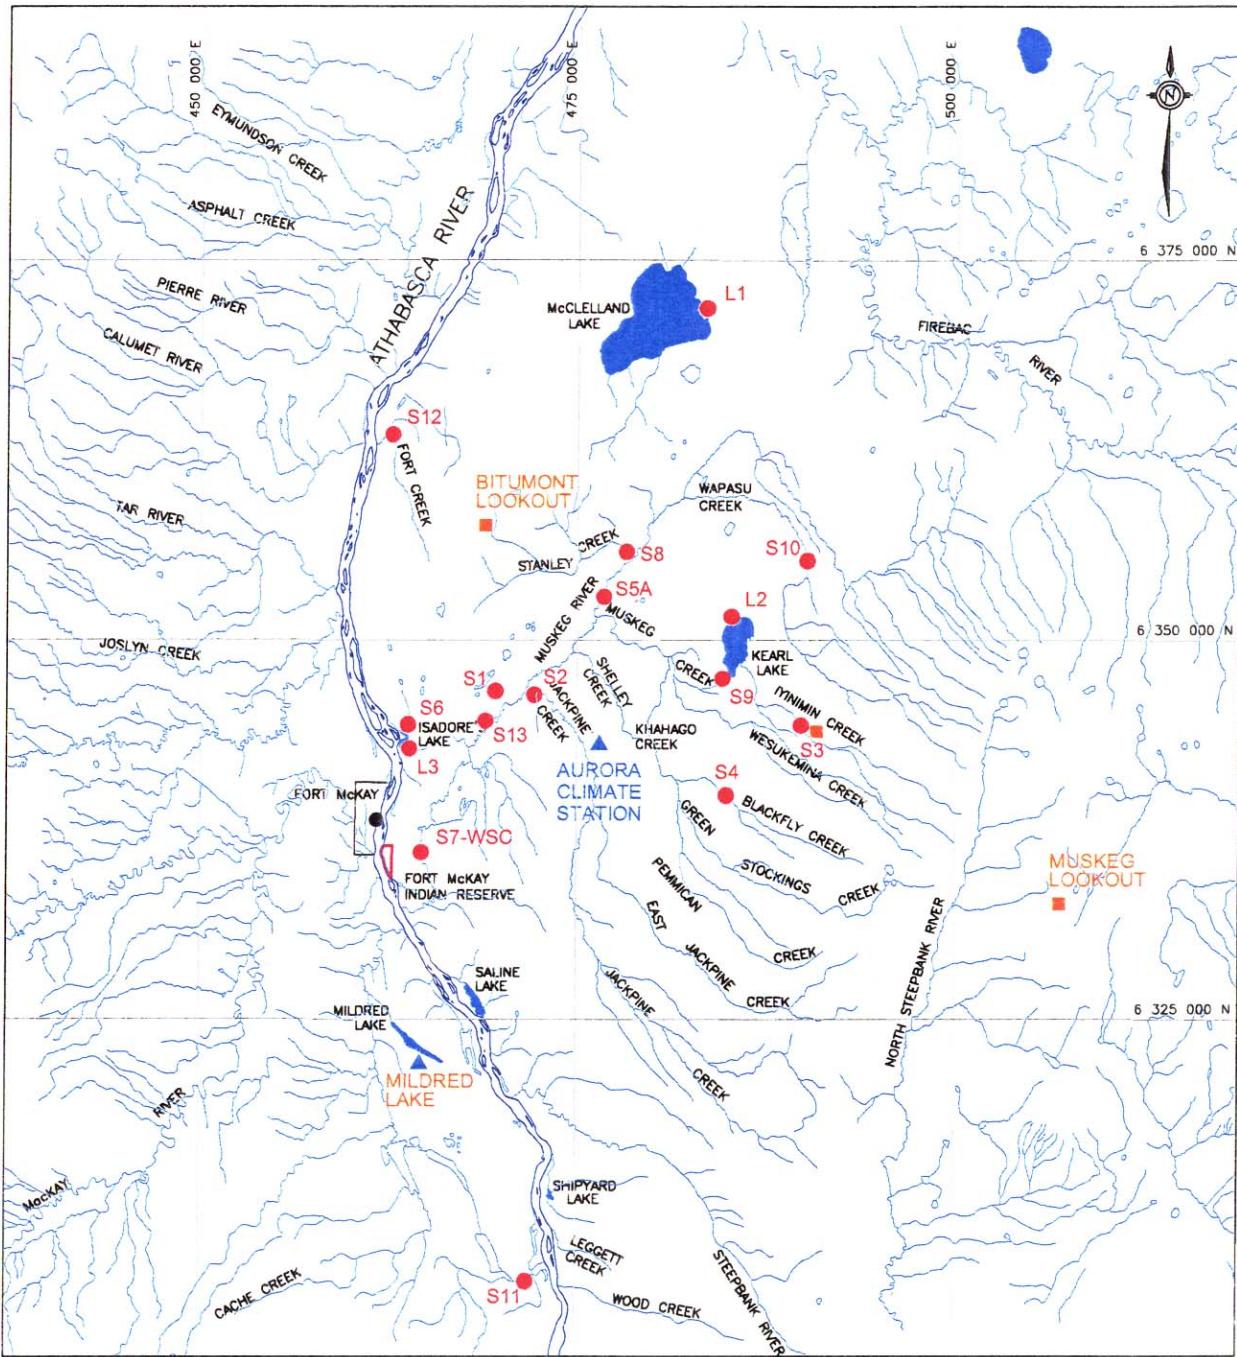

- collect and compile the climatic data recorded at the Aurora Climate Station;
- collect and compile snow course data in the Muskeg River basin;
- install an additional streamflow monitoring station at Fort Creek;
- collect, process and compile streamflow and total suspended solid (TSS) data at six streamflow monitoring stations in the Muskeg River basin, including a new station on Albian Pond #3, and three streamflow monitoring stations on Mills, Fort and Poplar creeks;
- collect, process and compile water level data at three lake-level monitoring stations at McClelland, Kearn and Isadore's lakes; and
- tie in local benchmarks to geodetic elevations and adjust database water levels accordingly.

The climatic and hydrologic data documented in this report were collected for the period from January to December 2000. Figure 1.1 shows the locations of the climatic and hydrologic monitoring stations covered in the 2000 program, which included the Aurora Climate Station and the following hydrologic stations:

- Alsands Drain (S1);
- Jackpine Creek (S2);
- Iyinimin Creek (S3) (inactive in 2000);
- Blackfly Creek (S4) (inactive in 2000);
- Muskeg River Aurora (S5A);
- Mills Creek (S6);
- Muskeg River WSC (S7);
- Stanley Creek (S8);
- Kearn Lake Outlet (S9) (inactive in 2000);
- Wapasu Creek (S10) (inactive in 2000);

- Poplar Creek (S11);
- Fort Creek (S12);
- Albian Pond #3 (S13);
- McClelland Lake (L1);
- Kearn Lake (L2); and
- Isadore's Lake (L3).

A brief description of the climatic and hydrologic conditions in 2000 is provided in Appendix VIII.

## 2 CLIMATIC MONITORING AT THE AURORA STATION

### 2.1 STATION DESCRIPTION

The Aurora Climate Station was initially installed for the OSLO project at the abandoned airstrip in Lease 34. The station was operated for only one year in 1988. Syncrude restored the operation of the climatic station in May 1995 as part of the baseline data collection program for the Aurora Mine Project. The Aurora Climate Station is located at 57° 14' 16" north latitude and 111° 24' 27" west longitude (SW-16-95-9-W4).

Table 2.1 summarizes the monitoring equipment installed at the climatic station. The devices for monitoring wind speed, wind direction, solar radiation and air temperature are mounted on a 10 m high tower set into a concrete base. The relative humidity meter, data logger, storage module and battery pack are mounted approximately 1.5 m above the ground level. The tipping-bucket rain and snow gauges are located away from the tower, approximately 1.0 m high on a base constructed from a section of steel culvert.

**Table 2.1 Monitoring Equipment at the Aurora Climate Station**

Type of Monitoring Equipment	Parameter Monitored or Function
Tipping-Bucket Rain Gauge (Campbell Scientific Model CS700-L)	total rainfall and rate of rainfall
Tipping-Bucket Snow Gauge (Texas Electronics TE525WS-L with CS705 snowfall conversion adaptor)	total snowfall and rate of snowfall
Anemometer (Young Model 05103-10)	wind speed and direction
Silicon Pyranometer (LI-COR Model LI200S)	solar radiation
Temperature and Relative Humidity Probe (Vaisala Model HMP45C with 41002 12-Plate Gill Radiation Shield)	ambient temperature and relative humidity
Sonic Ranger (Campbell Scientific Model SR50)	snow depth on ground
Measurement and Control Module (Campbell Scientific Model CR10)	datalogging
Solid State Storage Module (Campbell Scientific Model SM192)	storing data
Solar Panel and Battery Pack	solar panel for charging the battery pack

## 2.2 STATION OPERATION AND MAINTENANCE

The station operation and maintenance in 2000 included periodic site visits, inspection of the monitoring equipment, and exchange of the storage module containing data. The storage module was swapped and returned to the office to be downloaded without missing periods of data. The station was visited on January 11, February 21 and 22, March 10, April 2, April 20, May 15, 16 and 17, June 14, July 2, August 15, September 12, October 17 and November 8, 2000.

The station was retrofitted with a new tipping-bucket rain gauge and snowfall adapter on January 11, 2000, and the existing tipping-bucket rain gauge was returned to Calgary for maintenance and calibration. The snowfall adapter uses environmentally-friendly antifreeze to melt snowfall, and the mixture flows through the tipping-bucket mechanism. This sensor was installed to compare snowfall data against snow-on-ground data measured by the existing sonic ranger. The adapter also measures rainfall, but there is often a significant time lag between the rain or snowfall and bucket tip. The snowfall sensor is useful for measuring daily accumulations, but not for intensity-duration-frequency analysis of storms. Therefore, both precipitation gauges were operated at the Aurora Climate Station. The rain gauge with snowfall adapter can be removed for maintenance over mid-summer, and the other rain gauge without the snowfall adapter can be removed for maintenance over mid-winter.

Spare sensors for wind, temperature, relative humidity and solar radiation were exchanged for the existing sensors in 2000 to enable maintenance and calibration activities on the other climatic station sensors without losing data. The retrieved sensors were returned to Calgary for maintenance and calibration.

The Aurora Climate Station was out of service from January 11 to February 22, 2000. On January 11, the data logger program was inadvertently lost from memory during the installation of the new snowfall gauge. Due to extreme cold, the display on the computer normally used to check the logger operation was not functional and the service outage was not recognized until the next visit on February 21. The station was visited the next day, the program was reloaded and the station was once again operational.

The Aurora Climate Station was also out of service from April 2 to May 17, 2000 due to the loss of the data logger program from memory during a program upgrade. The station collected data continuously for the remainder of the year.

The two periods of missing data experienced during 2000 were inadvertent but avoidable. During the first period, extreme cold weather made it impossible to check whether data were being recorded. During the second, a check was made

to determine whether the station was operating properly. All sensors were functioning properly, but data was not properly transferred to the storage modules. The nature of the data storage system on this station means that data are only transferred to the storage module every hour, meaning that after swapping storage modules, field personnel could be forced to wait up to an hour to check that all is well. For this reason and others, this station should be considered a candidate for retrofitting with a remote data retrieval system. This is discussed further in Section 6.

## **2.3 DATA PROCESSING AND COMPIRATION**

The hourly climatic data recorded in the data-logger storage modules were downloaded nine times in 2000. Continuous measurements were available from January 1 to January 11, from February 22 to April 2, and from May 17 to December 31, 2000. These hourly data were processed to derive the daily and monthly data. The daily data are presented in Appendix I. Table 2.2 presents the monthly climatic data statistics based on the recorded data, including air temperatures, rainfall, snowfall, solar radiation, and wind speeds and directions. Rainfall and snowfall values from Fort McMurray Airport (MSC Station 3062693) have been used to supplement the recorded data and provide a complete record of monthly precipitation. Recorded and processed hourly climatic data collected in 2000 are stored on a compact disc in Appendix IX.

**Table 2.2 Summary of 2000 Climatic Data Statistics Recorded at the Aurora Climate Station**

\* Snowfall is expressed as snow water equivalent, based on measured snow depth and assuming a snow density of 0.1 g/cm<sup>3</sup> for freshly deposited snow.

† Values recorded at the Aurora Climate Station have been supplemented by data from Fort McMurray Airport (MSC Station 3062693) for the periods Jan 11 to Feb 22 and Apr 2 to May 17.

‡ Statistics based on incomplete monthly data.

## 3 SNOW COURSE SURVEY

### 3.1 PURPOSE

The purpose of a snow course survey is to provide data for determining average, accumulated snow depth for the watershed during a winter as well as snow redistribution in various terrain types. The resulting snowpack accumulation data are correlated with recorded snowfall data at a climate station to determine the snowfall undercatch correction factor and to provide accurate snowfall input to a hydrologic model for accurate model calibration and verification.

A program of snow course survey for a number of years (e.g., five years) is recommended to collect sufficient data for accomplishing the program objectives. Snow course surveys were previously undertaken in the Muskeg River basin in 1997, 1998 and 1999. The 2000 program was a continuation of this systematic snow course survey program. Although the survey was conducted in the Muskeg River basin from 1997 to 2000, the resulting snowpack data can be extrapolated to nearby basins with similar terrain types, wind and precipitation characteristics.

### 3.2 SNOWPACK AND TERRAIN TYPES

Snowpack accumulation is dependent on terrain type, which is a function of both topography and vegetation. In the Muskeg River basin, vegetation is the dominant feature dictating classification of the terrain types. The main terrain types defined for the snow course surveys undertaken from 1997 to 2000 included the following:

- flat low lying areas (with a mix of willow and shrub vegetation);
- mixed deciduous areas (with a mix of aspen, spruce, and other trees);
- open land areas (such as harvested areas with little vegetation);
- jack pine areas; and
- open lake areas.

Sixteen snow course survey plots were selected each year based on this terrain classification. Plots were identified by a visual assessment of the site.

### 3.3 SNOW COURSE MEASUREMENTS

The water equivalent of a snowpack (the equivalent depth of water if the snowpack is melted) is a product of snow depth and snow density. At each snow course survey plot, snow depths and snow densities were measured as follows:

- **Snow Depth Measurements**

At each plot, 30 depth measurements were made at randomly selected locations on a large circle. These depth measurements were taken by inserting a sharp rebar into the snowpack, reading the snowline mark and then measuring it with a tape.

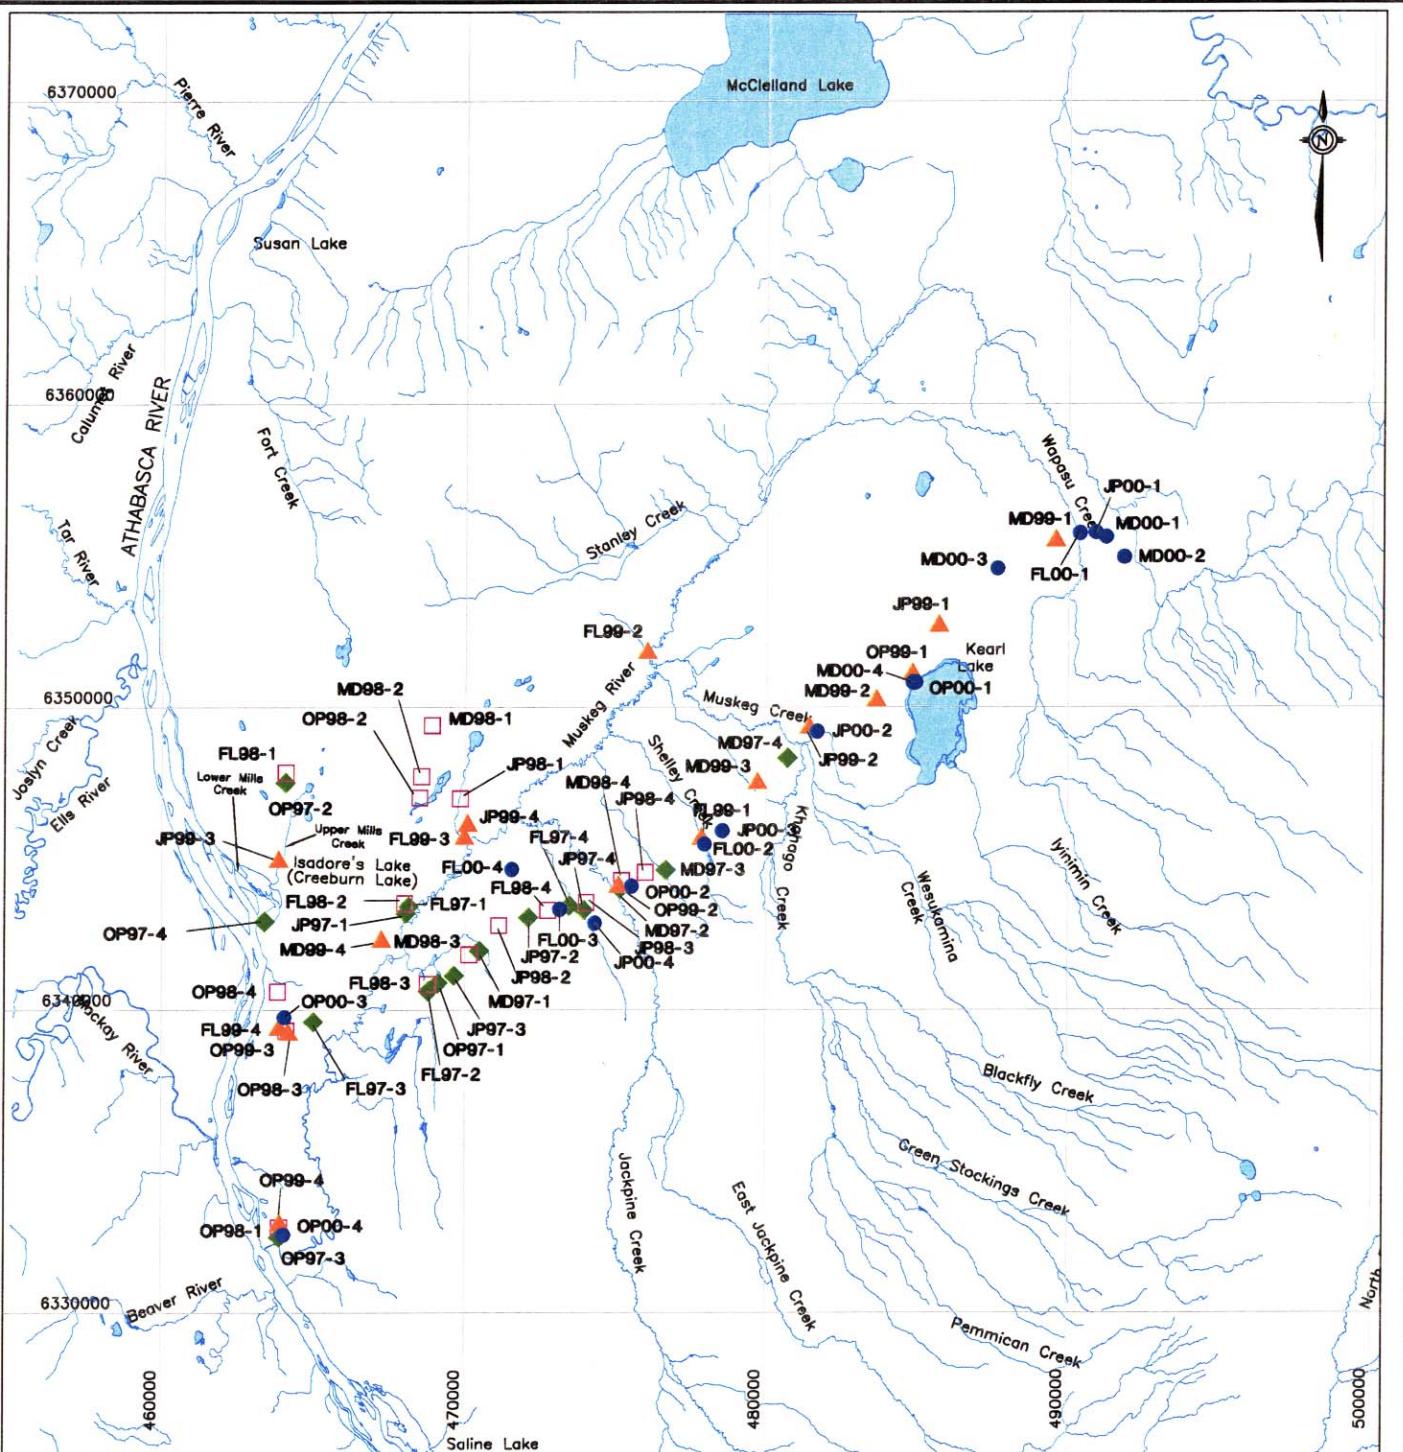

- **Snow Density Measurement**

Three density measurements were taken at each plot, using an Atmospheric Environment Services (AES) density sampler. The AES sampler was inserted carefully into the snowpack. Snow depth was read on the tube, when the corer reached the soil surface. The corer was then inserted/twisted more deeply into the ground to get a plug of soil to prevent the granular snow falling out of the bottom of the snow profile. The tube weight was measured (with and without snow) using the spring scale. The units of the spring scale directly provided the snow water equivalent (SWE) of the snowpack in centimetres.

Additional notes were taken on vegetation cover type, colour of snow surface, and snow consistency. Appendix II presents the terrain type, snow cover information and snowpack measurement data collected on March 12, 2000. For comparison with previous snow course data, the appendix includes the data collected from March 17 to 19, 1997 (Golder 1997a), March 14 to 16, 1998 (Golder 1999) and March 15 to 17, 1999 (Golder 2000). No photographs of sampling locations were taken in 2000, but photos representative of the various terrain types were provided in previous reports.

### 3.4 SUMMARY OF SNOW COURSE DATA 1997-2000

The snow course survey sampling locations for the 1997 to 2000 programs are shown on Figure 3.1. The snow course data collected are summarized in Table 3.1 and on Figure 3.2.

 Golder Associates	RAMP
SNOW WATER EQUIVALENT AND SNOW DENSITY OF VARIOUS TERRAIN TYPES	
DRAWN: BGM	APPROVED:
PROJECT: 002-2309.7000	DATE: 20 Feb. 2001
	FIGURE: 3.2

The data in Table 3.1 show that the snow density is relatively consistent throughout the five different terrain types surveyed. Therefore, the relative differences of snow depths between terrain types and years are directly reflected in variations in snow water equivalent (SWE) as described below.

The two terrain types, jack pine and mixed deciduous, have similar snow-water-equivalent depths (80 and 97 mm in 1997; 46 and 58 mm in 1998; 58 and 47 mm in 1999; 65 and 81 mm in 2000). Forest canopies intercept a percentage of precipitation (for both rain or snow) before it reaches the ground. The interception rate is proportional to the canopy coverage. Mixed deciduous tree sites, without leaves, have a more open canopy than jack pine sites and generally have a slightly greater snow-water-equivalent.

Flat low-lying areas feature a dense shrub coverage, which has a low interception rate, yet provides a wind-sheltered, calm area that maximizes snow accumulation potential (112 mm in 1997; 58 mm in 1998; 65 mm in 1999; 89 mm in 2000).

Open lake areas have the smallest snow-water-equivalent depth (31 mm in 1997; 48 mm in 1998; 40 mm in 1999; 16 mm in 2000), due to the wind swept, open nature of the site.

Open land areas (clearings) have snow-water-equivalent similar to that of the forest covers (85 mm in 1997; 52 mm in 1998; 48 mm in 1999; 112 mm in 2000). The original survey design called for only one category of open area. However, the survey results indicate that open land and open lake sites have distinctly different snow accumulations. Interception at the two sites is zero and the difference between the sites is likely due to differences in wind exposure.

## 4 HYDROLOGIC MONITORING

### 4.1 DESCRIPTIONS OF STATIONS

Hydrologic monitoring included the collection of streamflow, TSS and lake water level data. The streamflow monitoring stations included in this program are named S1 to S13 and the lake level monitoring stations are named L1 to L3. The stations at Fort Creek (S12) and Albian Pond #3 (S13) were installed and commenced operation in 2000. The monitoring stations at Iyinimin Creek (S3), Kearl Lake Outlet (S9) and Wapasu Creek (S10) were removed from service in 2000. Table 4.1 summarizes the pertinent details of the hydrologic monitoring stations included in the 2000 program. Additional information, including photographs and descriptions of equipment, is provided on each station's Factsheet in Appendix III.

**Table 4.1 Details of Hydrologic Monitoring Stations**

Station No.	Stream Name	Station Location		Basin Area (km <sup>2</sup> )	Period of Record
		Latitude (N)	Longitude (W)		
S1	Alsands Drain	57° 15' 12"	111° 29' 52"	15.8	1995 - 2000

## 4.2 STREAMFLOW MEASUREMENTS AND MONITORING

### 4.2.1 Summary

Manual measurements of stream discharges were performed at intervals over the winter (January to March and November to December), spring snowmelt (April) and summer months (May to October) in 2000. The water levels at these streamflow stations were continuously monitored by pressure transducers and recorded by data loggers over the summer months in 2000. The continuous monitoring period was extended at several stations where freezing to the streambed was not likely. Appendix IV presents a summary table of manual discharge measurements and the detailed calculation sheets for measurements performed in 2000.

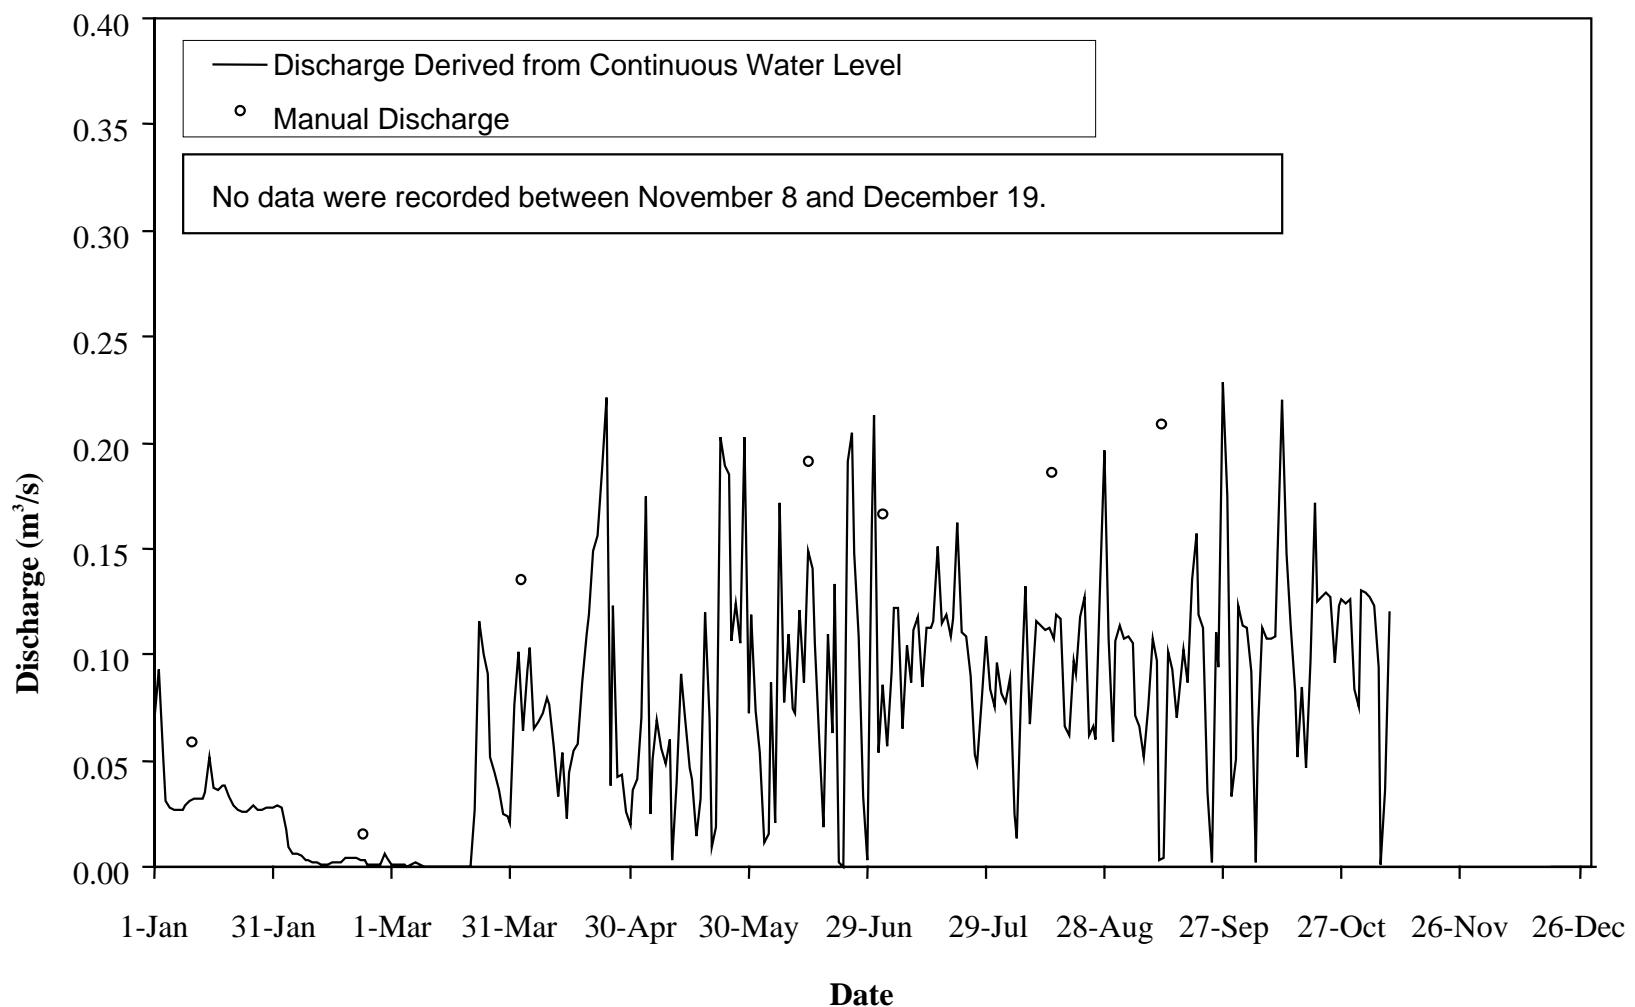

Manual discharge measurements from 2000 and, where applicable, 1997 through 1999, were used to develop stage-discharge rating curves for the streamflow monitoring stations. These rating curves were used to derive discharges from the continuous record of water level measurements. The resulting stage-discharge rating curves are presented in Appendix V. Appendix VI contains recorded daily water levels and derived stream discharges. A database containing the detailed raw and processed, water level and stream discharge data is stored on a compact disc in Appendix IX.

### 4.2.2 Alsands Drain Streamflow Monitoring Station (S1)

The Alsands Drain weir was in service throughout 2000 except for the period from November 8 to December 19, when the data logger battery failed and no data were recorded. The recorded hydrograph for this station is presented on Figure 4.1. It shows continuous records from January 1 to November 8 and December 19 to December 31, 2000. The rating curve for the weir was verified using data from eleven manual discharge measurements performed at this station on January 10, February 22, April 2, May 17, June 14, July 2, August 14, September 11, October 17, November 8 and December 19, 2000. The measured discharges are documented in Appendix IV and the current rating curve is provided in Appendix V. Mean daily water levels and discharges are provided in Appendix VI.

Note that pumping at this station results in rapid and significant fluctuations in discharge over the course of a typical day. Therefore, on Figure 4.1, mean daily discharges are shown instead of 15-minute discharges. Most measured discharges appear high, since the mean daily data typically incorporate periods of zero discharge.

**Figure 4.1 2000 Discharge Hydrograph at Alsands Drain Station (S1)**

#### **4.2.3 Jackpine Creek Streamflow Monitoring Station (S2)**

The Jackpine Creek station was relocated in April 2000 to a site just downstream of the Canterra Road bridge. This allowed road access to the site, where a helicopter was previously required. The new site is also superior because there does not appear to be a beaver dam problem, as there was at the old site. No significant tributaries enter Jackpine Creek between the two sites, so the catchment area measured by the station is essentially unchanged and data from the two sites will not require adjustment for comparison. A new rating curve was developed for the site in 2000.

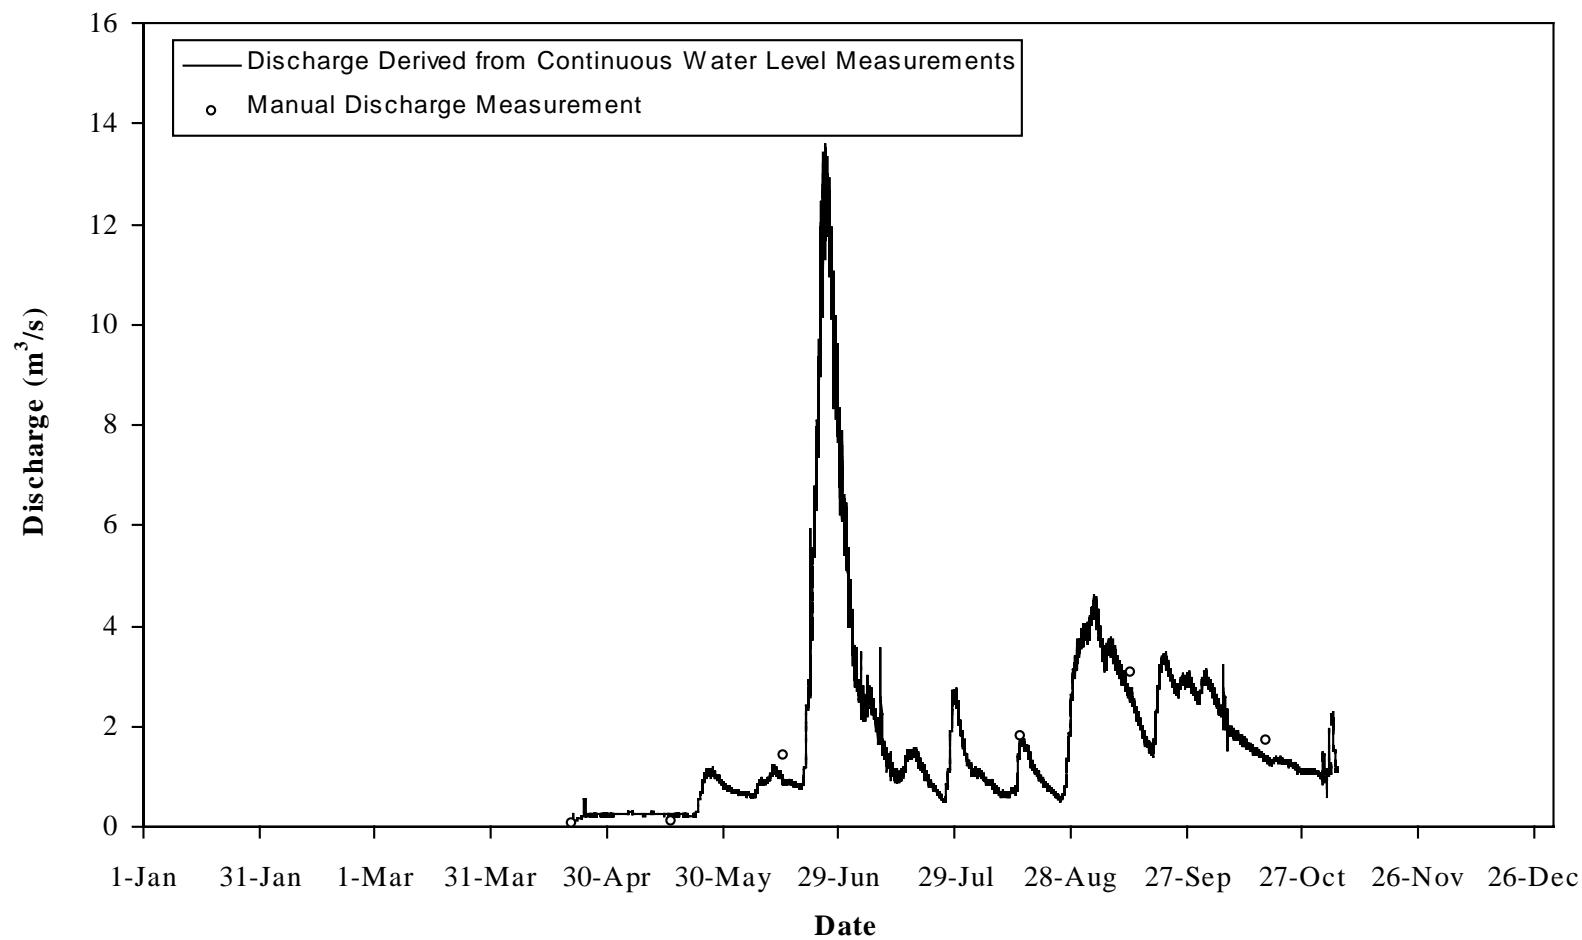

The recorded hydrograph for this station is presented on Figure 4.2. It shows a continuous record from April 20 to November 5, 2000. The pressure transducer and data logger were removed from this site in early November to prevent ice damage, as it was expected that the creek would freeze solid over the winter. Seven manual discharge measurements were performed at this station on April 20, May 16, June 14, August 14, September 12, October 17 and December 22, 2000. The site was also visited on July 2 and November 8 but discharge measurements were not performed on those dates. The measured discharges are documented in Appendix IV and the updated rating curve is provided in Appendix V. Mean daily water levels and discharges are provided in Appendix VI.

#### **4.2.4 Iyinimin Creek Streamflow Monitoring Station (S3)**

This hydrometric monitoring station was not operated in 2000. It was discontinued because it lies in the Aurora South Lease area, which will not be developed in the near future. It is recommended that the station be reactivated three to five years before development commences in the Aurora South Lease. The current rating curve for the station is provided in Appendix V.

A tipping-bucket rain gauge was installed at this station in May, 1998. The rain gauge was deactivated and placed in storage after the 1999 monitoring season. It is recommended that the rain gauge be reinstalled at a yet-to-be-determined location in the spring of 2001.

**Figure 4.2 2000 Discharge Hydrograph at Jackpine Creek Station (S2)**

#### **4.2.5 Blackfly Creek Streamflow Monitoring Station (S4)**

This hydrometric monitoring station was not operated in 2000. The decision to discontinue operation was based on its location in the Aurora South Lease area, which will not be developed in the near future. It is recommended that the station be reinstalled three to five years before development commences in the Aurora South Lease. When the station is reinstalled, it may be necessary to remove several beaver dams or relocate the gauge upstream or downstream of the current site. The current rating curve for the station is provided in Appendix V.

#### **4.2.6 Muskeg River Aurora Streamflow Monitoring Station (S5A)**

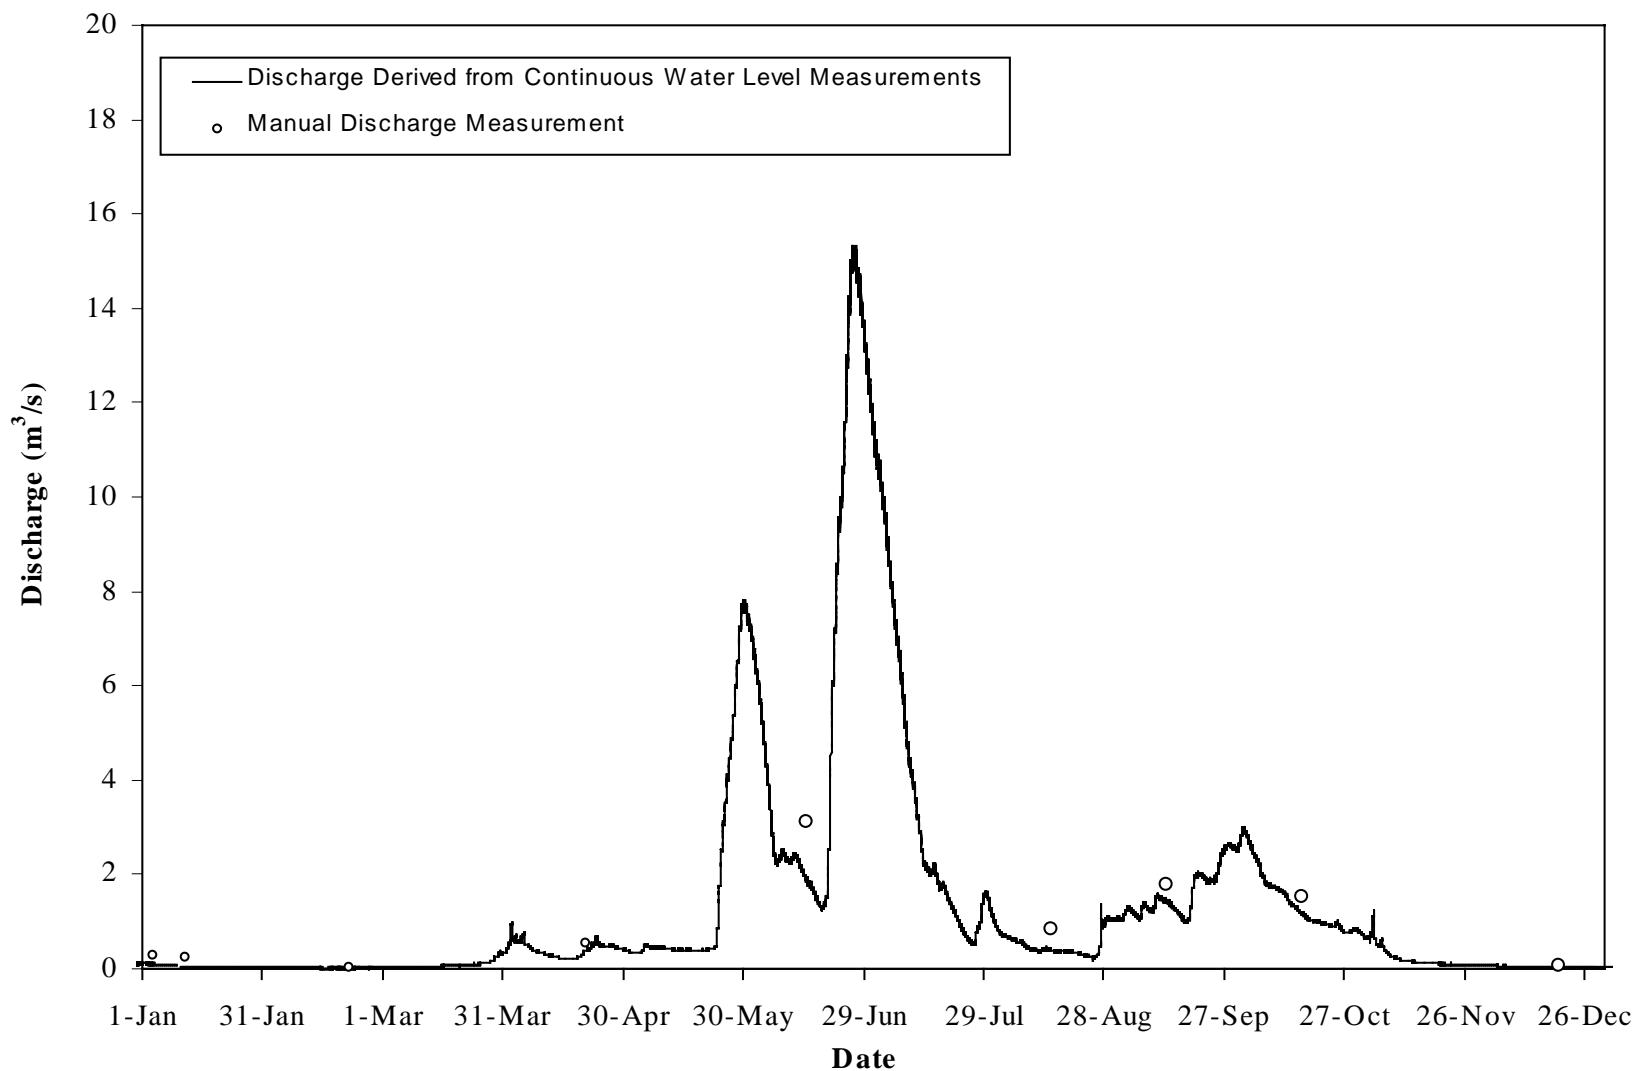

Summer and winter (ice covered) rating curves were updated for this station based on the data collected in 2000. The recorded hydrograph for this station is presented on Figure 4.3. It shows a continuous record from January 1 to December 31, 2000. Eight manual discharge measurements were performed at this station on January 11, February 21, April 20, June 14, August 14, September 12, October 17 and December 19, 2000. The station was also visited to download data on April 2, July 2 and November 10, 2000. The measured discharges are documented in Appendix IV and the updated rating curve is provided in Appendix V. Mean daily water levels and discharges are provided in Appendix VI.

The pressure transducer at this station was left in place during the winter to monitor the stage hydrograph through the winter, because the depth of water at this station protects it from potential damage due to freezing.

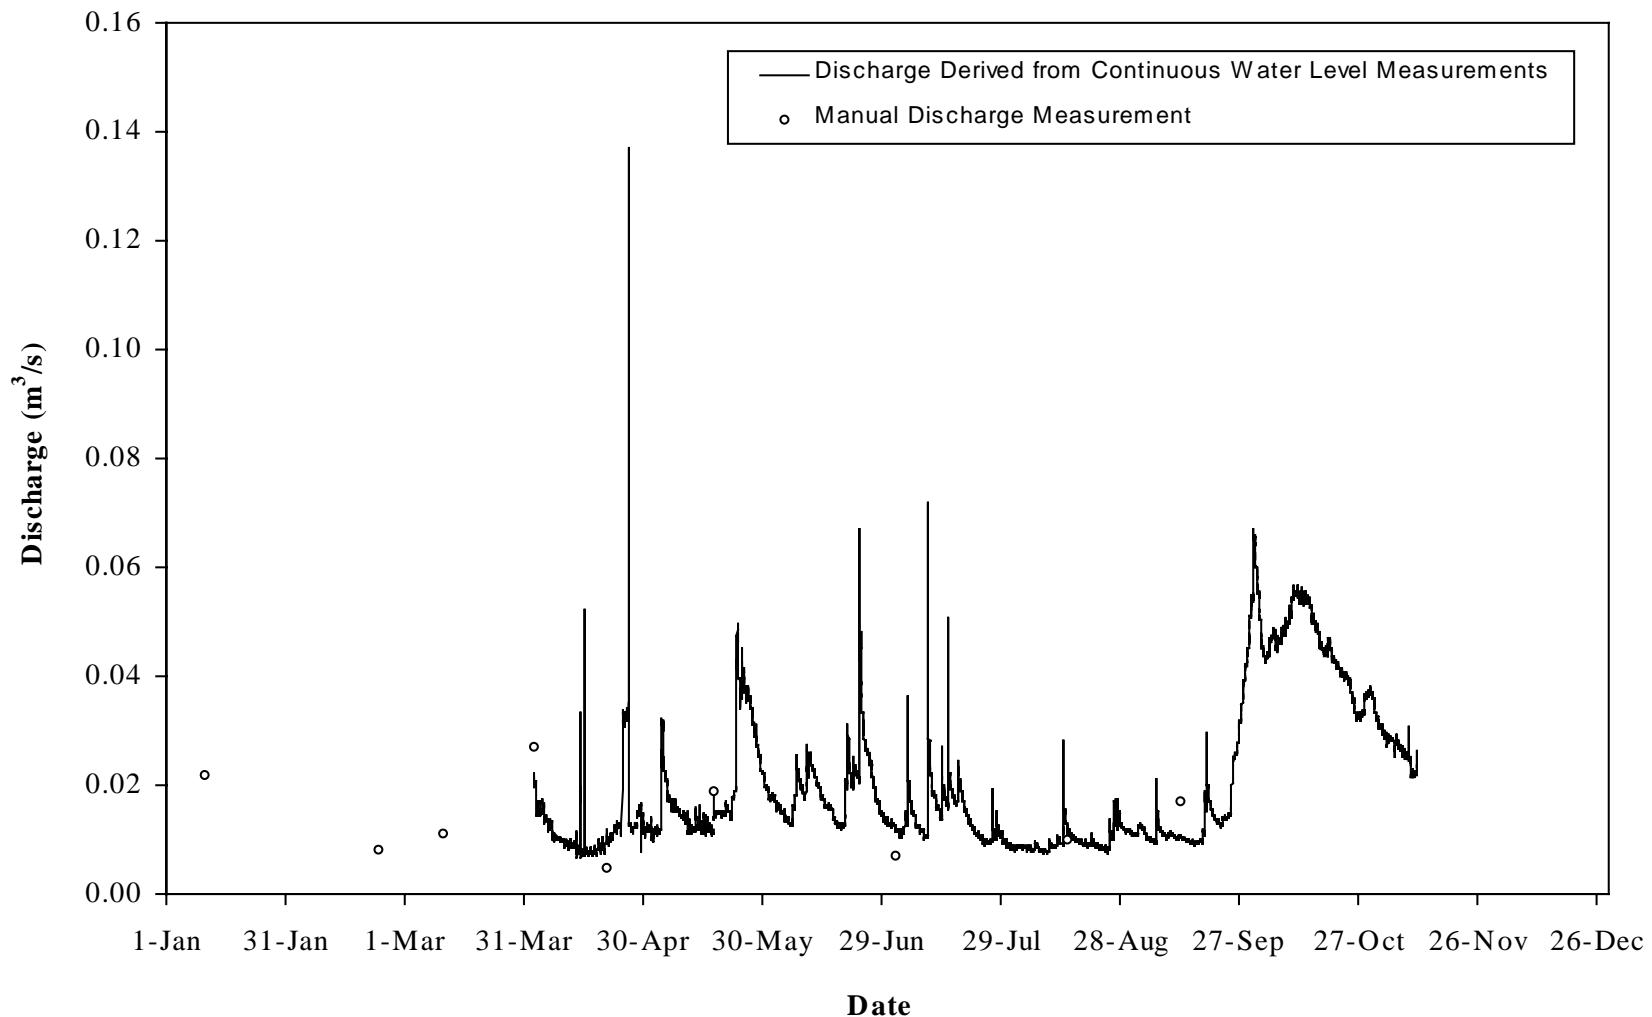

#### **4.2.7 Mills Creek Streamflow Monitoring Station (S6)**

The recorded hydrograph for this station is presented on Figure 4.4. It shows a continuous record from April 2 to November 10, 2000. Nine manual discharge measurements were performed at this station on January 10, February 23, March 10, April 2, April 20, May 17, July 2, August 14 and September 12, 2000. The station was also visited on November 10 and December 20, 2000. The measured discharges are documented in Appendix IV and the current rating curve is provided in Appendix V. Mean daily water levels and discharges are provided in Appendix VI.

**Figure 4.3 2000 Discharge Hydrograph at Muskeg River Aurora Station (S5A)**

**Figure 4.4 2000 Discharge Hydrograph at Mills Creek Station (S6)**

#### **4.2.8 Muskeg River WSC Streamflow Monitoring Station (S7)**

This station is operated by the Water Survey of Canada (WSC) during the open water season of each year. In 2000, Golder was responsible for performing winter discharge measurements and updating the winter rating curve. Monitoring equipment was left in place over the summer as a redundant measure in case WSC data were unavailable. The site was visited on January 12, February 21, March 12, April 20 and May 17, 2000 to conduct manual discharge measurements. The station was also visited on June 14, July 2, August 15, September 12, November 8 and December 20 to download data and/or perform manual water level measurements. In November 2000, a submersible pressure transducer was deployed for the duration of the winter. It will be retrieved after ice breakup to provide a continuous record of water levels for the winter months (November to February). Manual discharge measurements to provide data to update the rating curve are ongoing.

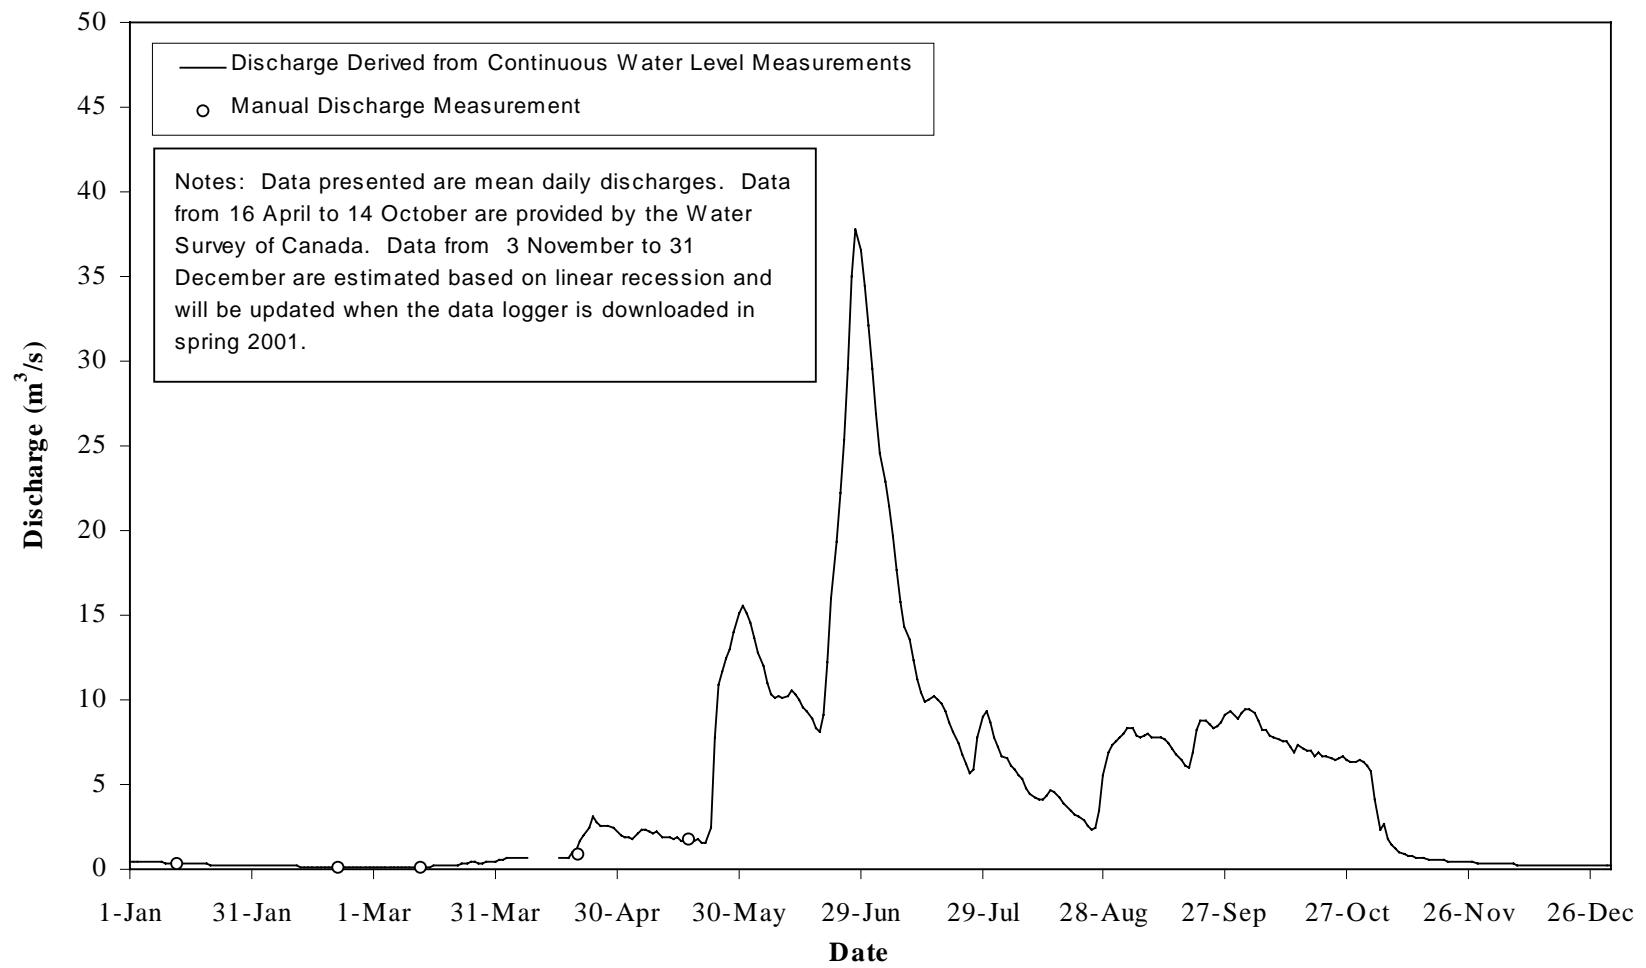

The mean daily discharge hydrograph for this station is presented on Figure 4.5. It shows a continuous record from January 1 to April 8 and April 16 to December 31, 2000. Discharges from November 3 to December 31, 2000 were estimated based a linear recession from the preceding measurements. These discharges will be recalculated when winter water level data are retrieved and the winter rating curve has been derived. The updated discharges will be presented in the 2001 RAMP Climate and Hydrology report database update. November and December 2000 data have been updated in the current database. The manual discharge measurements undertaken in 2000 are documented in Appendix IV and the current rating curve is provided in Appendix V. Mean daily discharges are provided in Appendix VI.

#### **4.2.9 Stanley Creek Streamflow Monitoring Station (S8)**

As in 1999, only water levels were monitored at this station. The station is at a site where the muskeg area narrows to less than 100 metres, but the channel is ill-defined and it is not possible to traverse the wet ground on foot. The ill-defined channel does not permit accurate discharge measurements.

The recorded water levels for this station are presented on Figure 4.6. It shows a continuous record from April 3 to November 9, 2000. Six manual water level measurements were performed at this station on April 3, May 16, July 3, September 13, October 18 and November 9, 2000. Mean daily water levels are provided in Appendix VI.

**Figure 4.5 2000 Discharge Hydrograph at Muskeg River WSC Station (S7)**

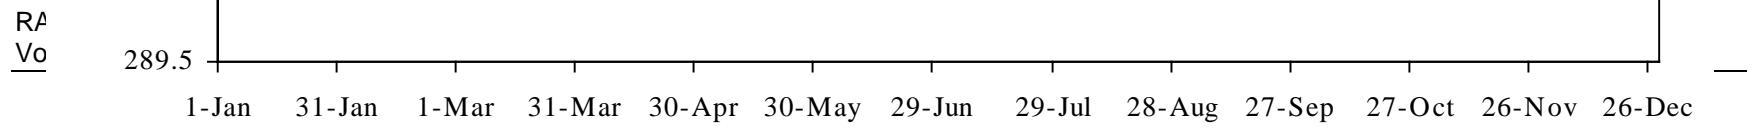

Fig.

#### **4.2.10 Kearn Lake Outlet Streamflow Monitoring Station (S9)**

This hydrometric station was not operated in 2000. The decision to discontinue operation was based on its location in an area that is not scheduled for development in the near future. This station could provide valuable data for calibrating regional hydrologic models, so consideration should be given to reactivating it, if funding is available. As a minimum, it is recommended that the station be reinstalled three to five years before development commences in Lease 31 (Syncrude Aurora South) or Lease 36 (Mobil Kearn). The current rating curve for the station is provided in Appendix V.

#### **4.2.11 Wapasu Creek Streamflow Monitoring Station (S10)**

This hydrometric station was not operated in 2000. The decision to discontinue operation was based on its location in an area that is not scheduled for development in the near future. This station could provide valuable data for calibrating regional hydrologic models, so consideration should be given to reactivating it, if funding is available. At a minimum, it is recommended that the station be reinstalled three to five years before development commences in Lease 31 (Syncrude Aurora South) or Lease 36 (Mobil Kearn). A new culvert road crossing is being constructed at this site in early 2001, so a reinstallation would not be able to use the previously installed equipment housing. The current rating curve for the station is provided in Appendix V.

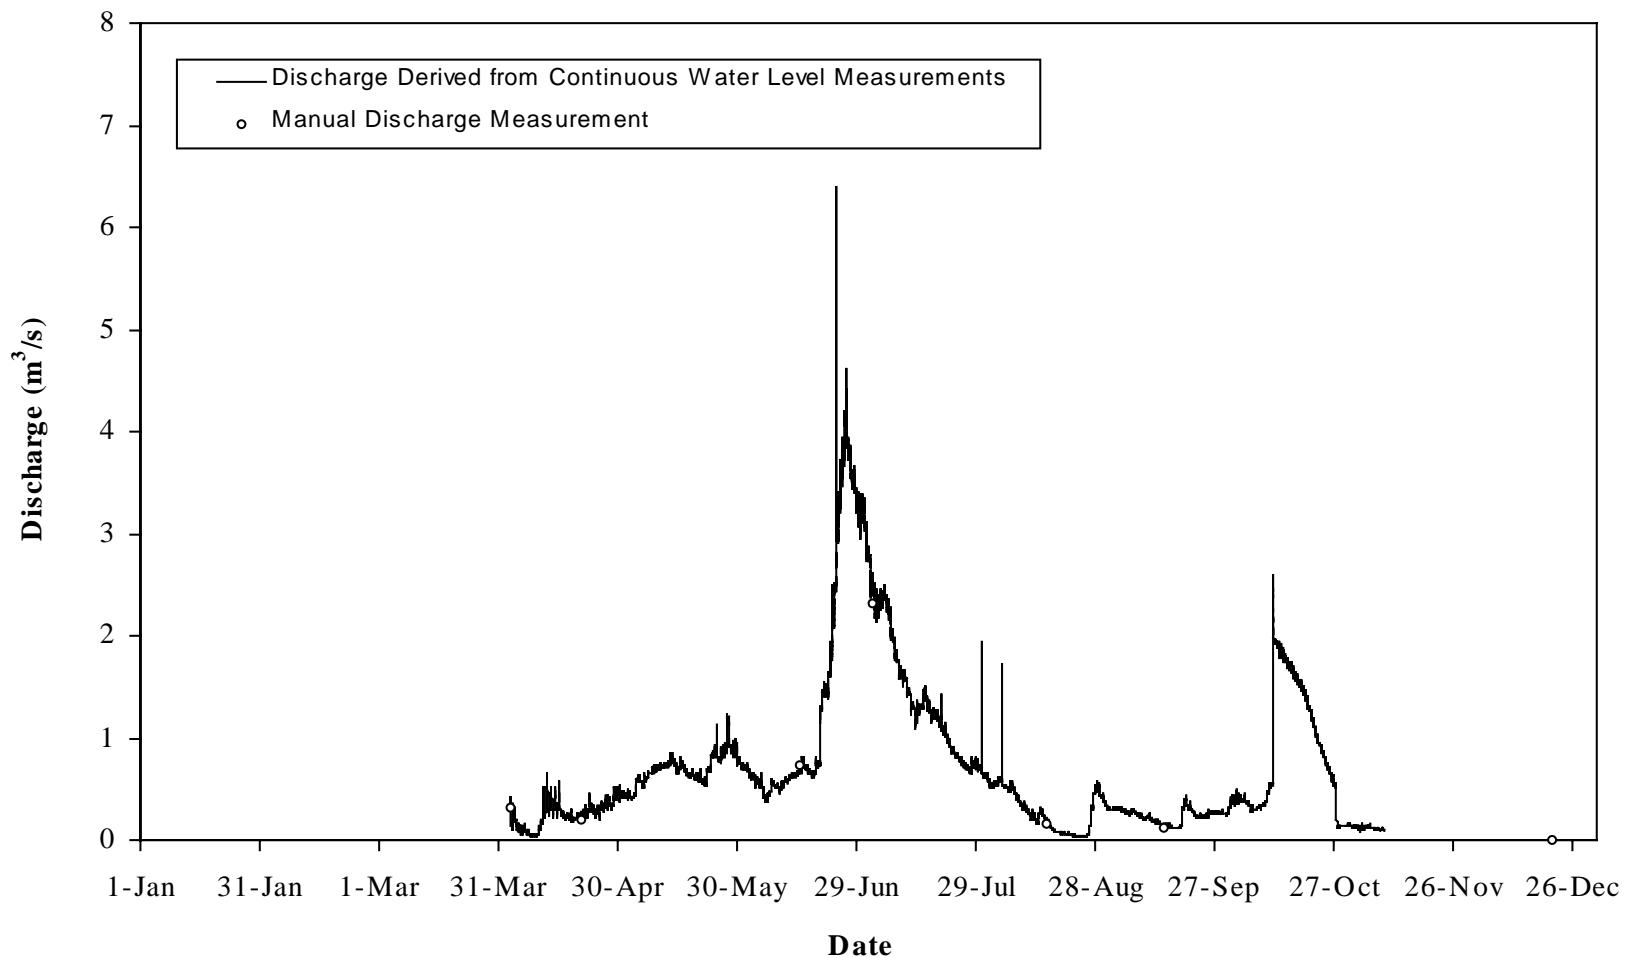

#### **4.2.12 Poplar Creek Streamflow Monitoring Station (S11)**

The recorded hydrograph for this station is presented on Figure 4.7. It shows a continuous record from April 2 to November 8, 2000. Ten manual discharge measurements were performed at this station on January 12, February 24, April 2, April 20, May 17, June 14, July 2, August 15, September 14 and December 20, 2000. The station was also visited on November 8, 2000. The measured discharges are documented in Appendix IV and the updated rating curve is provided in Appendix V. Mean daily water levels and discharges are provided in Appendix VI.

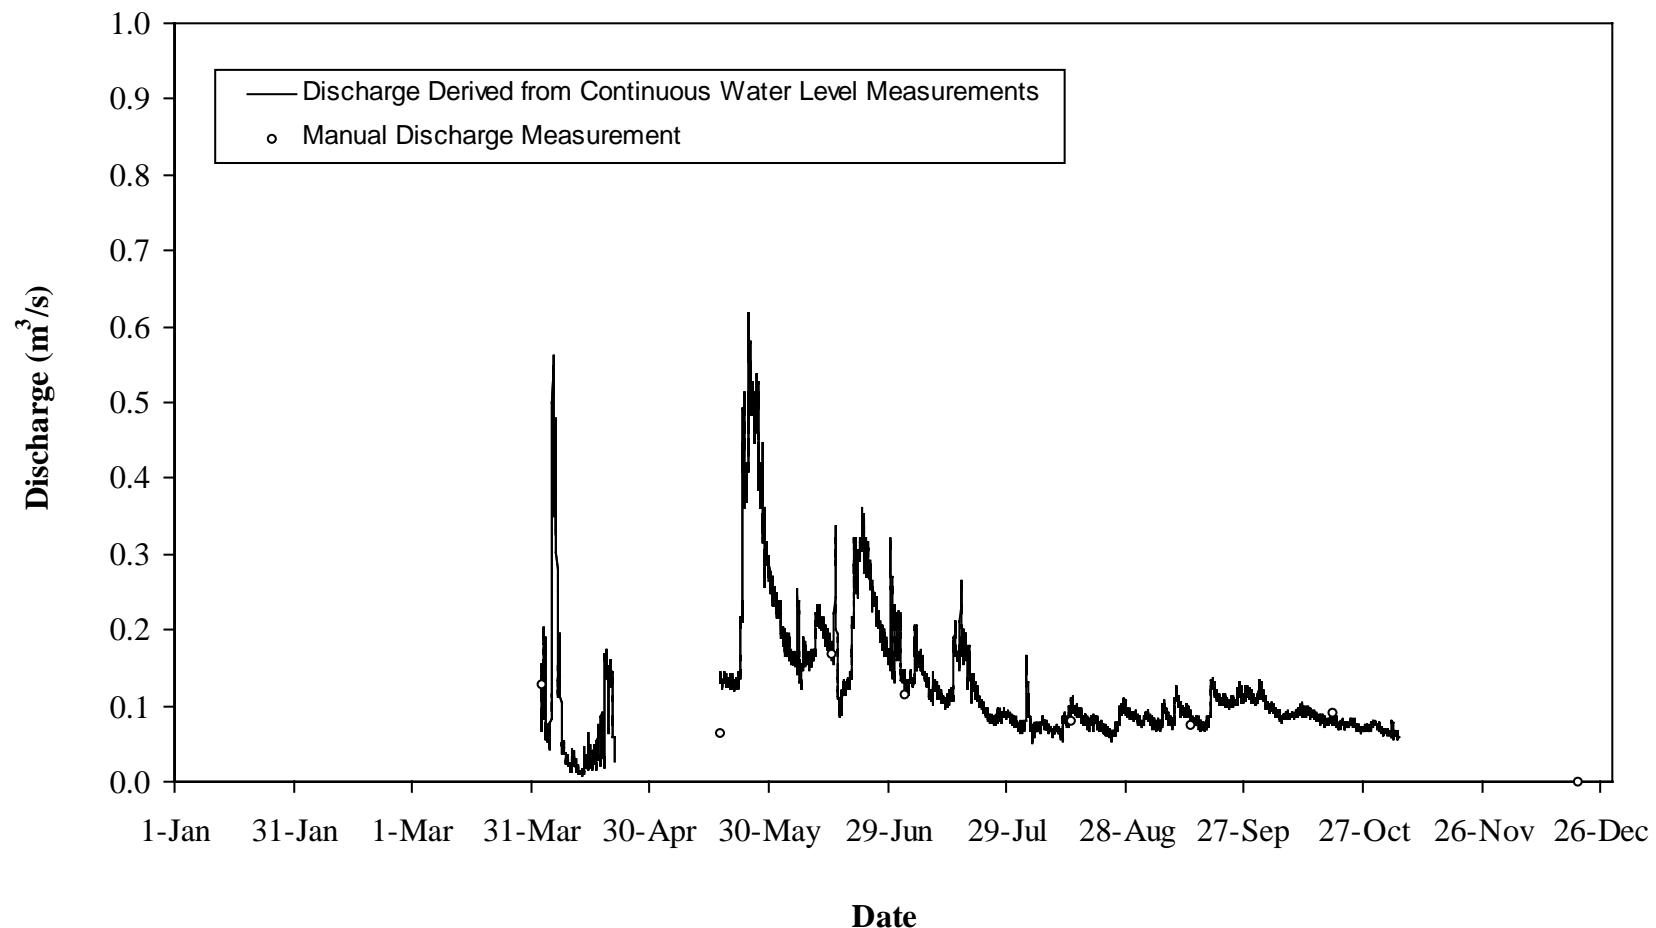

#### **4.2.13 Fort Creek Streamflow Monitoring Station (S12)**

This station was installed on Fort Creek, just downstream of Highway 63, in April 2000. A rating curve was developed using the discharge and water level data collected in 2000. The recorded hydrograph for this station is presented on Figure 4.8. It shows continuous records from April 2 to April 20 and May 17 to November 10, 2000. No data were recorded between April 20 and May 17, when

**Figure 4.7 2000 Discharge Hydrograph at Poplar Creek Station (S11)**

**Figure 4.8 2000 Discharge Hydrograph at Fort Creek Station (S12)**

water levels receded below the level of a temporarily installed pressure transducer. Eight manual discharge measurements were performed at this station on April 2, May 17, June 14, July 3, August 14, September 13, October 19 and December 20, 2000. The station was also visited on November 8, 2000. The measured discharges are documented in Appendix IV and the rating curve is provided in Appendix V. Mean daily water levels and discharges are provided in Appendix VI.

#### **4.2.14 Albian Pond #3 Streamflow Monitoring Station (S13)**

This station was installed at the outlet of Albian Polishing Pond #3 in March, 2000. A theoretical weir rating curve was derived and checked using the data collected in 2000. The recorded hydrograph for this station is presented on Figure 4.9. It shows a continuous record from March 2 to December 31, 2000. Six manual discharge measurements were performed at this station on June 14, July 2, August 14, September 11, October 17 and December 19, 2000. The station was also visited on April 2, May 15, May 17 and November 8, 2000. The measured discharges are documented in Appendix IV and the rating curve is provided in Appendix V. Mean daily water levels and discharges are provided in Appendix VI.

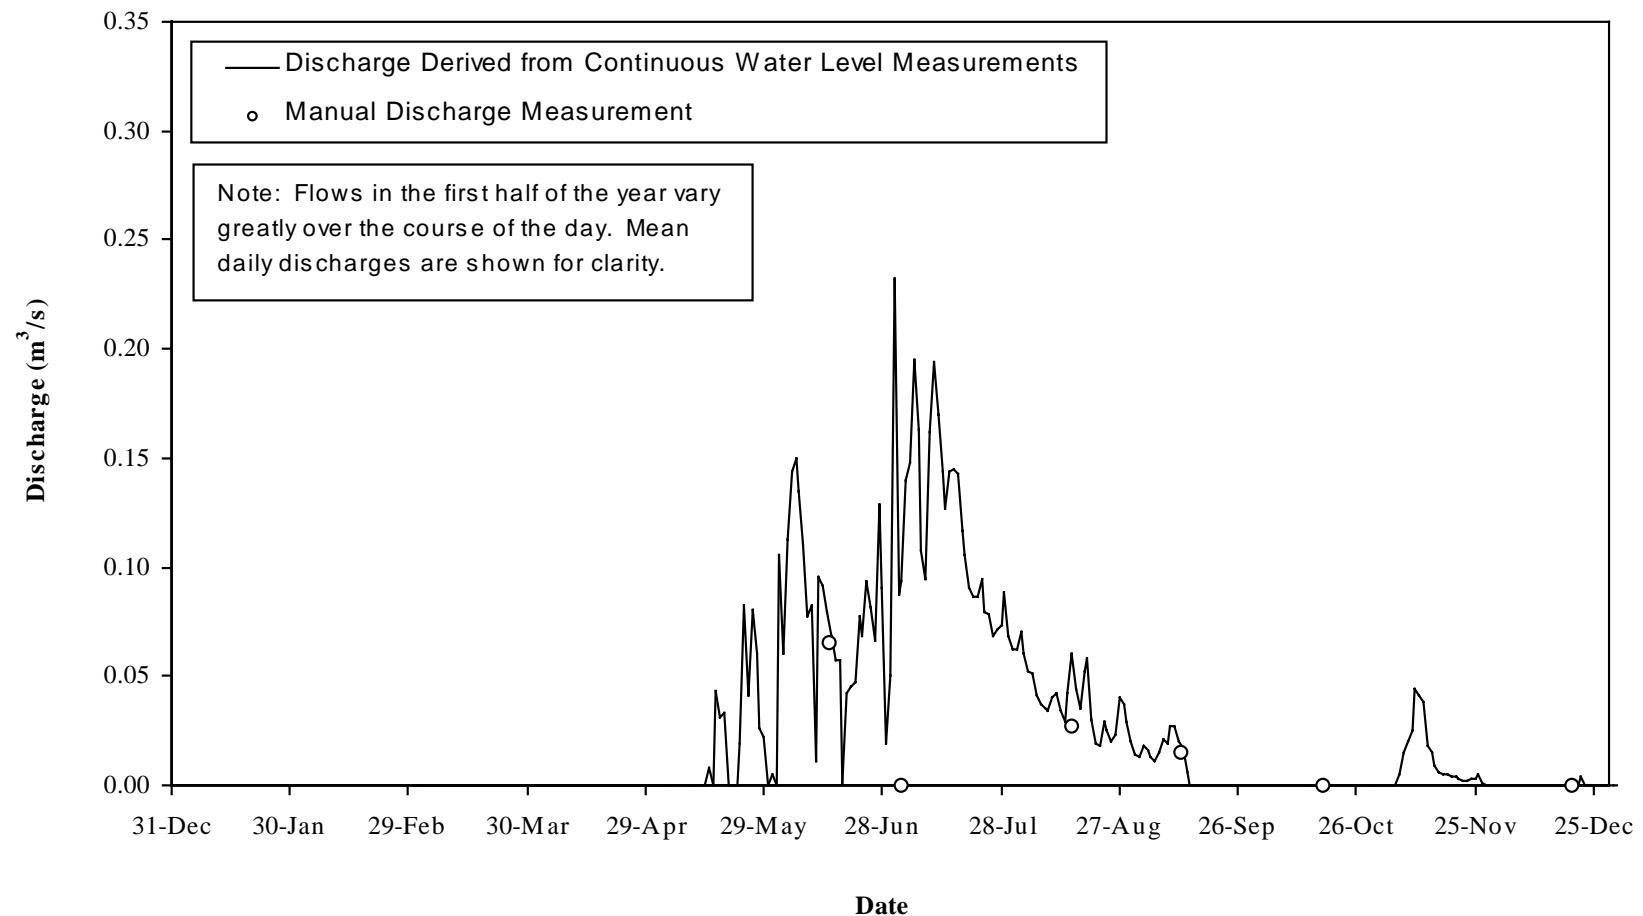

#### **4.2.15 McClelland Lake Water Level and Outflow Monitoring Station (L1)**

The recorded hydrograph for this station is presented on Figure 4.10. It shows a continuous record from May 16 to November 9, 2000. Discharges were not derived for the period from October 28 to November 9, due to ice effects at the lake outlet. Six manual discharge measurements were performed at this station on April 3, May 16, July 3, September 13, October 19 and November 9, 2000. The measured discharges are documented in Appendix IV and the outlet rating curve is provided in Appendix V. Mean daily water levels and discharges are provided in Appendix VI.

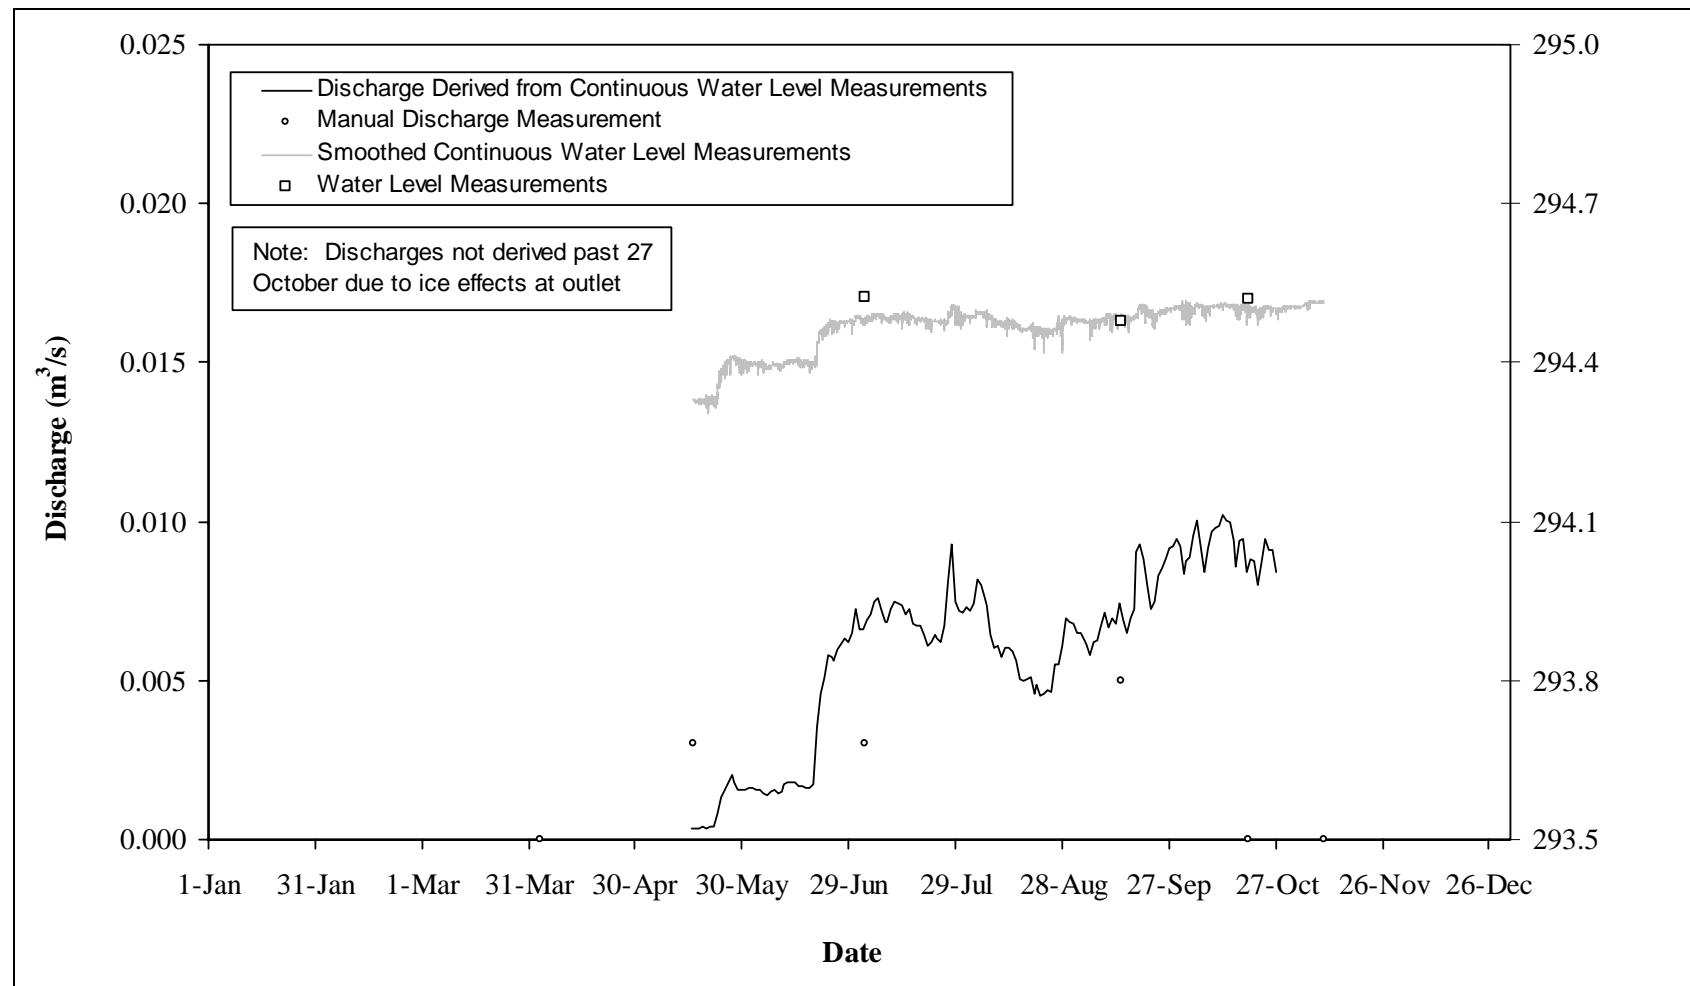

#### **4.2.16 Kearl Lake Water Level Monitoring Station (L2)**

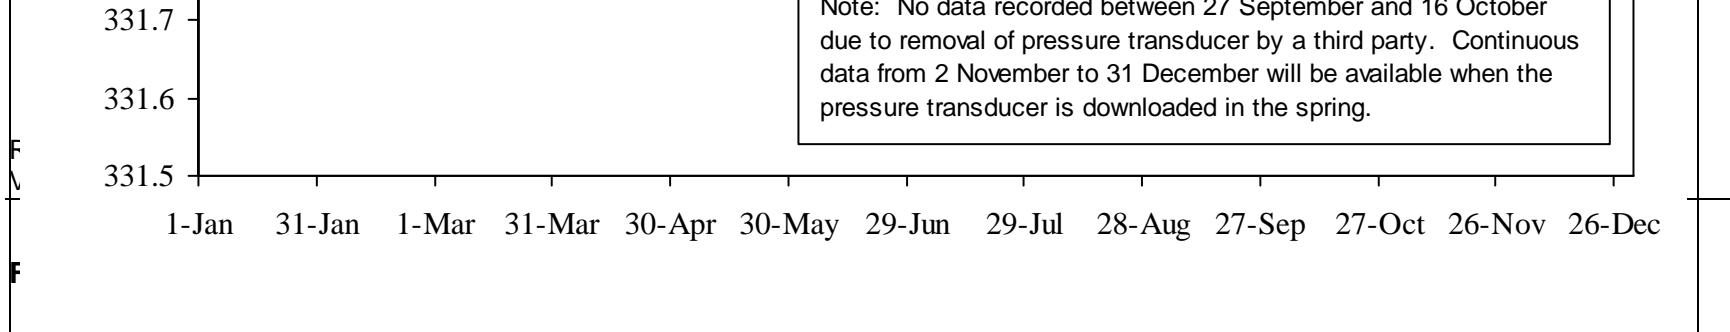

The recorded hydrograph for this station is presented on Figure 4.11. It shows a continuous record from February 22 to September 13 and from October 16 to November 2, 2000. No data were recorded between September 13 to October 16, because the pressure transducer was removed from the site by a third party. The transducer was returned and reinstalled as soon as possible after its return. The pressure transducer were left in place over the winter and data from November 2 onwards will be downloaded as soon as possible after the ice is out of the lake.

**Figure 4.9 2000 Discharge Hydrograph at Albion Pond #3 Station (S13)**

**Figure 4.10 2000 Water Level and Discharge Hydrographs at McClelland Lake Station (L1)**

Ten manual water level measurements were recorded at this station on February 22, April 2, April 20, May 17, June 14, August 15, September 12, October 17, November 8 and December 22, 2000. Raw data from the pressure transducer was corrected using atmospheric pressure data recorded at the Aurora Climate Station (C1). Mean daily water levels are provided in Appendix VI.

#### 4.2.17 Isadore's Lake Water Level Monitoring Station (L3)

This station was installed for the first time in February 2000. The recorded hydrograph for this station is presented on Figure 4.12. It shows a continuous record from February 22 to November 2, 2000. The pressure transducer was left in place over the winter and data from November 2 onwards will be downloaded as soon as possible after the ice is out of the lake. Three manual water level measurements were recorded at this station on May 17, June 14 and November 8, 2000. The station was also visited on February 22, October 17 and November 2. Raw data from the pressure transducer was corrected using atmospheric pressure data recorded at the Aurora Climate Station (C1). Mean daily water levels are provided in Appendix VI.

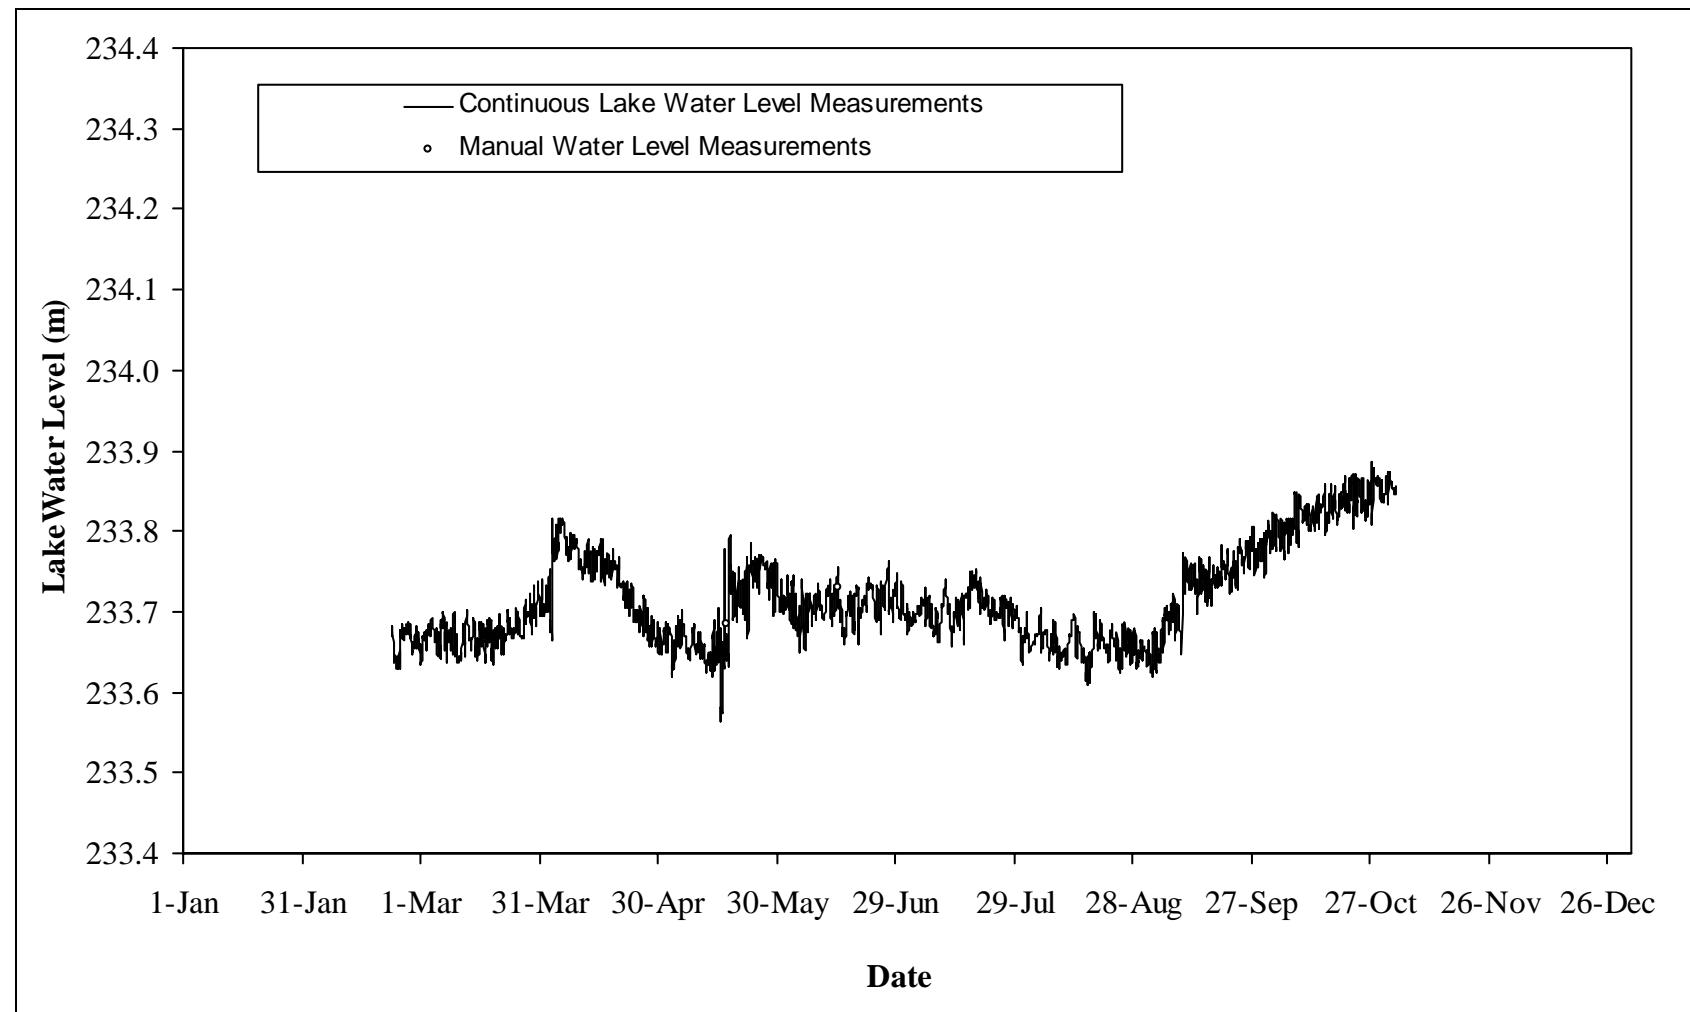

### 4.3 HIGH WATER MARK SURVEY

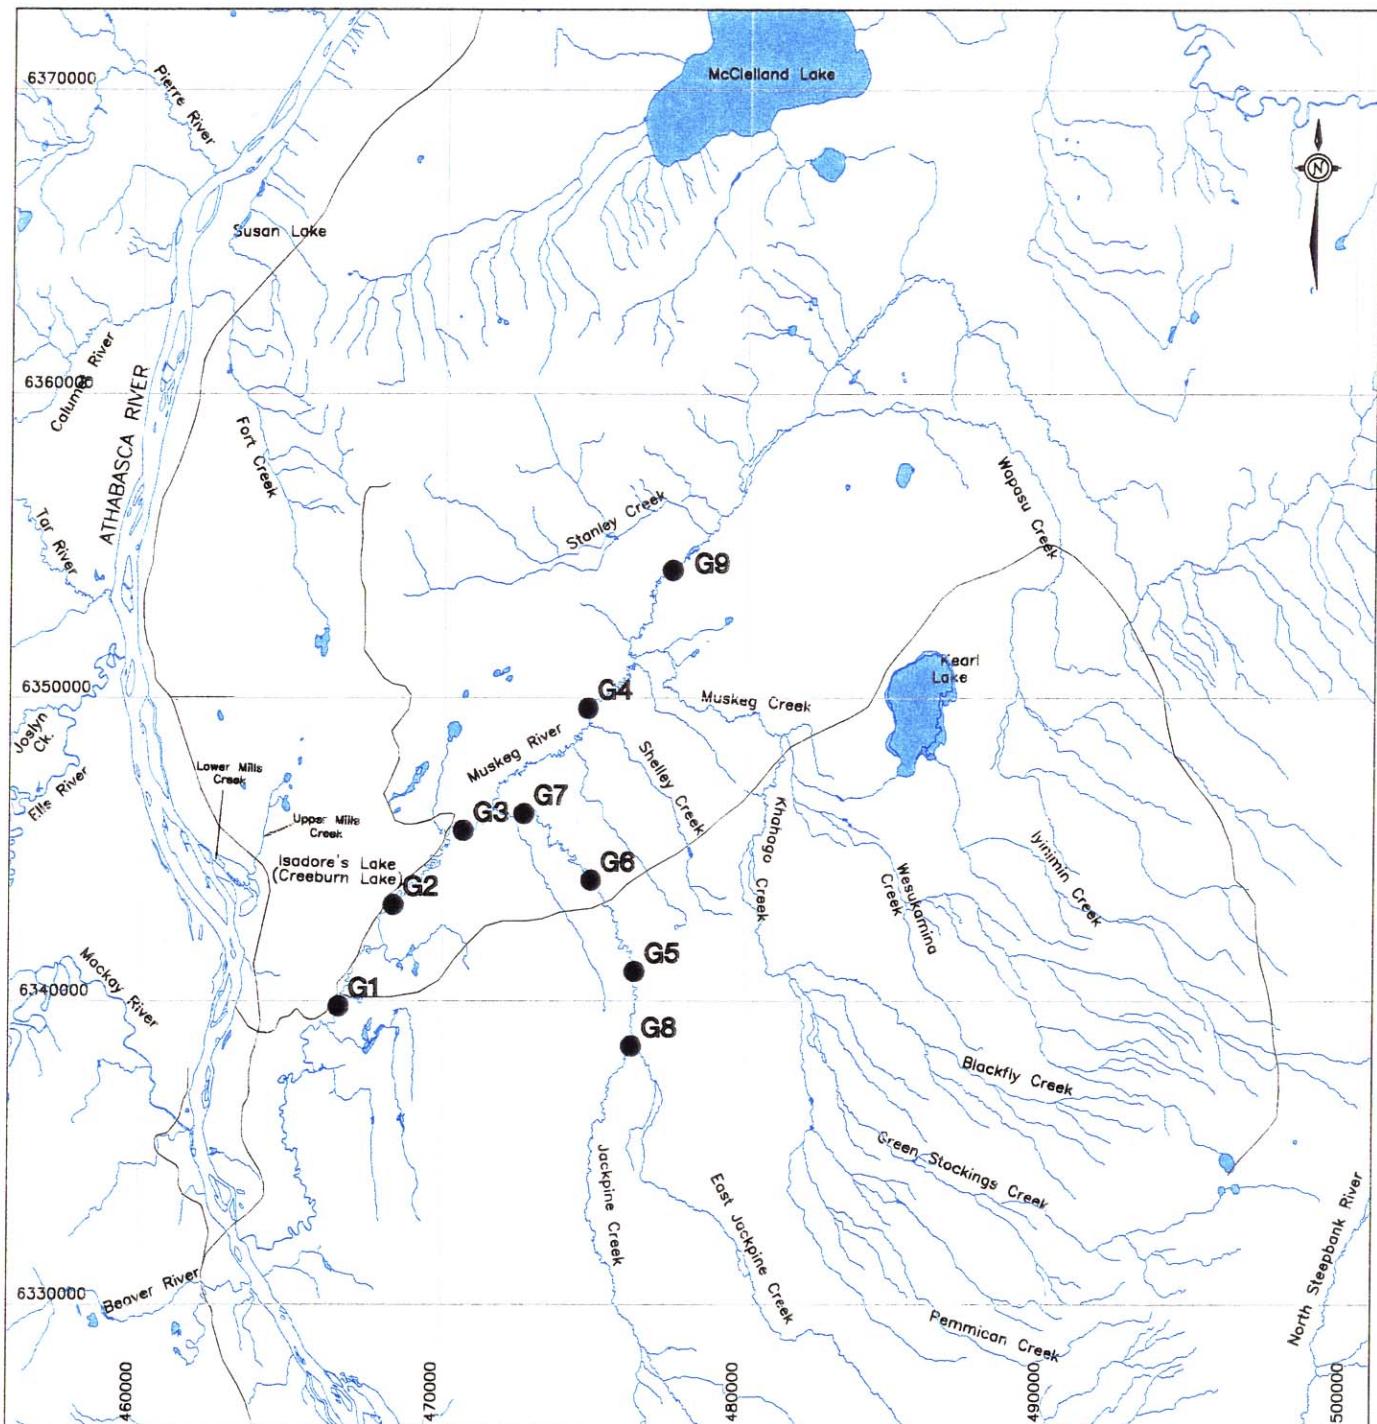

Five staff gauges were installed along the study reaches of the Muskeg River in 1999 to record high water marks. Locations of the high water mark gauges are provided in Table 4.2 and shown on Figure 4.13. Staff gauges were not deployed at sites on Jackpine Creek in 1999 or 2000, because the adjacent lease area will not be developed in the near future. It is recommended that these staff gauges be reactivated three to five years before development commences in the adjacent lease.

**Table 4.2 Locations of High Water Mark Gauges**

Muskeg River			Jackpine Creek (Not Installed in 1999 or 2000)		
Gauge No.	N. Latitude	W. Longitude	Gauge No.	N. Latitude	W. Longitude
G1	57° 12' 22"	111° 33' 13"	G5	57° 14' 18"	111° 24' 44"

#### LOCATION PLAN FOR HIGH WATER MARK GAUGES

DRAWN: TVS	APPROVED:	DATE: 16 Feb. 2001
PROJECT: 002-2309.7000		FIGURE: 4.13

Revision No.: 01

The high water marks provide required data for calibration and verification of a flood hydraulic model. The model can then be used to compute flood levels for preparation of flood risk maps along the study reaches. The resulting flood risk maps are required for ensuring safety of the mining facilities located adjacent to the river floodplain and for developing appropriate erosion protection measures.

Data collected during the 1997 monitoring program were used for calibrating the HEC-RAS hydraulic model, and it was recommended that the high water mark collection program be continued for another two to four years to collect sufficient data for updating the calibration and verification of the hydraulic model. No high water mark data were acquired in 1998 because the recording method was ineffective. In 1999, the gauges were coated with a mixture of sawdust and paint and this method proved adequate. Unfortunately, 1999 was a very dry year with a very small flood peak, and the data collected are not expected to be useful for hydraulic model calibration or verification. High water marks from the flood event of late June, 2000 were successfully measured at the five staff gauges on the Muskeg River. High water mark data from 1997 to 2000 are provided in Table 4.3.

## 4.4 MEASUREMENTS OF TOTAL SUSPENDED SOLIDS

Measurements of total suspended solids (TSS) concentration are required to characterize the watershed and channel sediment yields and erosion, and to monitor streamflow water quality. Water samples were regularly collected

during site visits to each hydrologic monitoring station in 2000. These samples were tested in a laboratory to determine the concentration of TSS. Table 4.4 summarizes the TSS measurements conducted in 1997 through 2000. The derived concentration-discharge rating curves for TSS are shown on Figure 4.14, Figure 4.15 and Figure 4.16.

Figure 4.14 presents the TSS data from four stations including Jackpine Creek (S2), Iyinimin Creek (S3), Blackfly Creek (S4) and Muskeg River Aurora (S5A). The basins monitored by these stations have less in-channel and off-channel storage than the basins in Figure 4.16. Tentative TSS rating curves are shown on this figure for all basins. Iyinimin and Blackfly creeks have similar TSS rating curves and similar basin areas, as do Jackpine Creek and the Muskeg River. If TSS is plotted against discharge per unit area, all four curves fall very close to one another. This indicates similar basin sediment yield characteristics among these basins.

Figure 4.15 presents the TSS data from three stations including Kearn Lake Outlet (S9), Wapasu Creek (S10) and Fort Creek (S12). The Kearn Lake Outlet basin has considerable storage upstream in Kearn Lake. Fort Creek and Wapasu Creek have frequent beaver dams located in their upper reaches. The TSS rating curve shown for Kearn Lake Outlet is only tentative, since TSS at high discharges has not been measured on this stream.

Figure 4.16 presents the TSS data from other stations, including the Alsands Drain (S1), Mills Creek (S6), Poplar Creek (S11) and Albian Pond #3 (S13). The TSS characteristics at the Alsands Drain and Albian Pond #3 are affected by dewatering and polishing pond settling. The TSS characteristics at Mills Creek are affected by a weir on the channel and Poplar Creek is affected by significant lake storage upstream. The available TSS data for these stations are too scattered to enable construction of any rating curves.

## 5 INSTALLATION AND MAINTENANCE

### 5.1 WORK PERFORMED IN 2000

#### 5.1.1 Aurora Climate Station (C1)

This station was retrofitted with a new tipping-bucket snowfall gauge on January 11, 2000, and the tipping-bucket rainfall gauge was returned to Calgary for maintenance and calibration. The rainfall gauge was reinstalled on April 2, 2000 and the two gauges operated in tandem for the remainder of the year. This provided redundancy for the summer months and direct measurement of snowfall in the winter months. Mounting hardware for both tipping-bucket gauges was also upgraded in 2000.

Spare sensors for wind, temperature, relative humidity and solar radiation were purchased in November 1999 to permit regular sensor maintenance and calibration without any loss of data. The new wind sensor and solar radiation sensors were installed on May 17, 2000, using a cherry-picker provided by Syncrude. The temperature and relative humidity sensor required a data logger, program revision to accommodate a new wiring configuration, and was installed on September 12, 2000. The retrieved sensors were returned to Calgary for maintenance and calibration.

Since the Kearn Lake Outlet Station (S9) was taken out of service at the end of 1999, the data logger and barometer previously deployed there were relocated to the Aurora Climate Station. The atmospheric pressure data recorded by this barometer are essential to post-processing data from the Muskeg River WSC (S7), Kearn Lake (L2) and Isadore's Lake (L3) stations.

#### 5.1.2 Jackpine Creek Monitoring Station (S2)

Reinstallation of the Jackpine Creek Station was previously recommended because of deterioration of the equipment housing and the presence of beaver dams at the site. The station was reinstalled at a new site, several kilometres upstream of the previous location. This site was primarily selected for ease of access. It is located immediately downstream of the Canterra Road bridge, removing the need for a helicopter to access the site. There are also no beaver dams evident in the vicinity of the station. Since there are no significant tributaries located between the new and old station locations, they have similar drainage areas. No adjustments will be required to compare discharges measured before and after the station relocation.

### **5.1.3 Fort Creek Streamflow Monitoring Station (S12)**

A pressure transducer and data logger were installed temporarily at this site on April 2, 2000. The site was surveyed for permitting in October 2000.

### **5.1.4 Albian Pond #3 Streamflow Monitoring Station (S13)**

The weir and equipment housing for this station, located on the Albian Muskeg River Mine Site, were installed by Albian Sands in March 2000. The pressure transducer and data logger were installed in the equipment housing after construction and remained for the rest of the year.

### **5.1.5 Kearl Lake Station (L2)**

Syncrude applied for a licence of occupation for the hydrometric station at Kearl Lake (L2) and this was granted on June 16, 2000. A copy of the Letter of Authority for LOC 001050 is provided in Appendix VII. The temporary installation was subsequently replaced with a more robust permanent installation on October 17, 2000.

### **5.1.6 Isadore's Lake Station (L3)**

Syncrude applied for a licence of occupation for the hydrometric station at Isadore's Lake (L3) and this was granted on June 16, 2000. A copy of the Letter of Authority for LOC 001053 is provided in Appendix VII. The temporary installation was subsequently replaced with a more robust permanent installation on October 17, 2000.

### **5.1.7 Geodetic Surveys**

All survey benchmarks associated with the RAMP climatic and hydrologic component were surveyed using GPS equipment by Can-Am Surveys Ltd. in October 2000. This allowed all water surface elevations at stream discharge, lake level and high water gauges to be referenced to geodetic elevations. Benchmark elevations for hydrometric stations S1 to S13 and L1 to L3 are summarized in Appendix V.

## **5.2 WORK RECOMMENDED FOR 2001**

### **5.2.1 Jackpine Creek Streamflow Monitoring Station (S2)**

Permitting for the relocated Jackpine Creek Station (S2) is currently being undertaken by Syncrude. When permitting is completed, a permanent equipment housing should be installed at this site.

### **5.2.2 Muskeg River WSC Streamflow Monitoring Station (S7)**

Permitting for the Muskeg River WSC Station (S7) is currently being undertaken by Syncrude. When permitting is completed, a permanent equipment housing should be installed at this site.

### **5.2.3 Fort Creek Streamflow Monitoring Station (S12)**

Permitting for the Fort Creek Station (S12) is currently being undertaken by Syncrude. When permitting is completed, a permanent equipment housing should be installed at this site.

### **5.2.4 Remote Data Retrieval Retrofitting**

The integration of hydrometric stations to monitor mine site discharges into the program has produced new scheduling requirements to accommodate monthly reporting schedules. Often, it is difficult to schedule field visits to properly meet reporting requirements. Therefore, it is recommended that selected stations be retrofitted with equipment to allow remote data retrieval via a cellular telephone interface. The Alsands Drain (S1), Albian Pond #3 (S13) and Aurora Climate (C1) stations would be prime candidates for this measure, and other stations may be considered. Besides allowing more frequent data downloads without additional travel costs, remote data retrieval systems allow system status checks and alarms with immediate notification in case of monitoring system failures. Remote data retrieval systems are commercially available from several suppliers at a reasonable cost.

## **6 UPDATE OF THE REGIONAL CLIMATIC AND HYDROLOGIC DATABASE**

The 2000 program included the important task of updating the regional climatic and hydrologic database. The updated database is stored in a compact disc (CD) for ease of data access. Development and continuing updates of this database are required to protect the monitoring investments and to provide readily-accessible data for future water management studies, characterize baseline conditions and comply with permit conditions.

The database CD included in Appendix IX of this report contains data from local monitoring programs and regional data collected by the Meteorological Services Canada (MSC) and Water Survey of Canada (WSC). Data included in the database CD are summarized in Table 6.1. Tables 6.2, 6.3, 6.4 and 6.5 present descriptions of site locations and available data for local hydrologic stations, local climatic stations, regional hydrologic stations, and regional climatic stations, respectively.

**Table 6.1    Contents of Database CD in Appendix IX**

Local Data		Regional Data	
Hydrology	Climate	Hydrology	Climate

## 7 CONCLUSIONS AND RECOMMENDATIONS

The 2000 monitoring program, jointly funded and commissioned by Syncrude, Albian, Mobil, Suncor, TrueNorth and Petro-Canada, has resulted in collection of the climatic and hydrologic data documented in this report. The program has fulfilled the monitoring objectives and resulted in an expansion of the climatic and hydrologic database for the Oil Sands Region, particularly for the Muskeg River basin. The specific contributions of the 2000 monitoring program are summarized below.

- Continuing operation of the Aurora Climate Station contributed to expansion of the regional climatic database and provided required climatic information for interpreting the hydrologic monitoring results. The climatic station was fitted with a new rain gauge with snowfall adapter and spare sensors were purchased to facilitate regular maintenance.
- A fourth year of snow course survey for various terrain types expanded the snowpack database necessary for determining the snowfall undercatch correction factor and providing required input to calibrate and verify a snowmelt runoff model.
- The 2000 program resulted in installation of new water level monitoring stations on Fort Creek (S12) and Albian Pond #3 (S13), and reinstallation of the Jackpine Creek streamflow monitoring station (S2).
- The 2000 streamflow measurements and monitoring were conducted to meet regulatory requirements and contributed to an expansion of the existing streamflow database that is required to develop reliable stage-discharge rating curves and discharge hydrographs at the monitoring stations.
- The 2000 water level monitoring at McClelland Lake (L1) was conducted to meet regulatory requirements and contributed to an expansion of the hydrologic database for assessing the impacts of the regional oil sands developments on the lake.
- The 2000 TSS measurements contributed to an expansion of the existing TSS database required to monitor watershed and channel erosion and streamflow water quality and to develop more reliable predictive tools to correlate TSS concentrations with streamflows. Sufficient data have been acquired for long-term stations such that TSS measurements need only be undertaken during high discharges, supplemented with a limited number of low discharge measurements.
- Ongoing operations of the monitoring stations provided a basis for identifying the maintenance needs and developing a work plan for the upcoming 2001 monitoring program.

- The 2000 program has resulted in development of a regional climatic and hydrologic database updated to the end of 2000. This database is stored on a compact disc for easy access by users.

It is recommended that the collection of climatic and hydrologic data at the existing monitoring stations be continued and that the monitoring should cover the entire year including winter low flows, snowmelt and summer flows. Continuation of the monitoring program is required for development of an improved hydrologic database, which will allow updating of previous hydrologic analyses and modelling based on site-specific data. The continuation will also provide the hydrologic data necessary for monitoring any potential impacts of the oil sands projects as required by regulatory agencies. The specific recommendations for the 2001 monitoring program, which were identified during the 2000 program, are summarized below.

- The operations and maintenance of the climatic and hydrologic monitoring stations, and the relevant data collection should be continued.
- A snow course survey in the Muskeg River basin should be conducted in early March 2001 to collect a final year of snowpack data to complete the five year program.
- Monitoring of high water marks along the study reach of the Muskeg River should be continued for one more year.
- Consideration should be given to retrofitting at least three monitoring stations (C1, S1 and S13) to allow remote data retrieval.
- The deactivated precipitation gauge from station S3 should be reinstalled at an alternate stream or lake monitoring station.
- The status of deactivated monitoring stations (S3, S4, S9 and S10) should be reviewed.

**APPENDIX II**  
**1997-2000 SNOW COURSE SURVEY DATA**

**Table II-1 Summary of 2000 Snow Course Survey Data**

Terrain Type	Survey Plot No	Date of Survey	GPS Location	Snow Density (g/cm <sup>3</sup> )	Snow Depth (cm)	Snow Water Equivalent (mm)	Description of Vegetation	Snow Cover Appearance
flat low lying	FL-00-1	12-Mar-00	6355733 N 490343 E	0.255	41.7	106.5	- 80% covered with willow av. ht. 2.0m	- white, hard crust (15 cm), coarse grained, no snow underneath willows
	FL-00-2	12-Mar-00	6345470 N 477936 E	0.270	34.3	92.6	- willow (3m tall) 80% - understory - dead willow and grass	- white, hard crust 10 cm on top, coarse grained, no or some snow underneath willows
	FL-00-3	12-Mar-00	6343322 N 473105 E	0.196	48.6	95.3	- willow (3m tall) 50% alder –10%, fireweed 18% area surrounded by jackpine	- white, hard crust (15 cm), coarse grained
	FL-00-4	12-Mar-00	6344638 N 471511 E	0.190	33.2	63.1	- dead tamarack, grass jackpine (5 cm dia. 3m ht.) – 1%	- white, clean, crust on top very coarse grained
open land	OP-00-2	12-Mar-00	6344085 N 475525 E	0.356	39.1	139.3	- previously cleared area, surrounded by spruce (5 to berry 70%, alder 10%	- white, clean, wet, medium to coarse grained
	OP-00-3	12-Mar-00	6339755 N 464040 E	0.280	30.2	84.7	- poplar 2m ht., dia. 7 cm clover/buffaloberry/fireweed willows with slightly vegetation grass	- white, very compact, dry coarse grained
	OP-00-4	12-Mar-00	6332571 N 464026 E	0.354	17.8	63.0	- surrounded by spruce along the shoreline	- slightly dirty, wet, coarse grained
open lake	OP-00-1	12-Mar-00	6350817 N 484916 E	0.181	9.0	16.2	- surrounded by spruce and willows along the shoreline	- white, compact to ice cover, coarse grained clean
mixed deciduous	MD-00-1	12-Mar-00	6355611 N 491214 E	0.207	38.9	80.5	- aspen 65% canopy with 20m, dia.20 cm, white spruce 3m –5m, understory 20%, alder 2m ht.	- white, compact, coarse grained hard crust at top.
	MD-00-2	12-Mar-00	6354947 N 491807 E	0.232	39.5	91.6	- canopy 80%, poplar aspen av. ht 25m dia. 15 cm, spruce 2%, ht. 5m dia. 10 cm understory 20 % alder av. ht. 2m	- white, compact, coarse grained hard crust at top.
	MD-00-3	12-Mar-00	6354569 N 487617 E	0.232	36.5	84.8	- poplar - 65%, av. ht.25 m, dia. 20 cm white spruce 34% av. ht. 15m dia. 10 cm understory – alder 60%	- white, sticky, wet coarse grained no crust on top
	MD-00-4	12-Mar-00	6350813 N 484827 E	0.177	38.1	67.6	- canopy 60%. poplar - 95%, av. ht.20 m, dia. 18 cm, spruce 5% ht. 12m dia, 7 cm. understory birch/wild rose and fireweed	- white, dry coarse grained
jack pine	JP-00-1	12-Mar-00	6355758 N 490867 E	0.204	42.3	86.2	- jack pine - 70%, av. ht.-20m, dia. 15 cm. understory - white spruce 5% alder 10% moss floor	- white, compact, coarse grained
	JP-00-2	12-Mar-00	6349196 N 481670 E	0.180	35.3	63.4	- jack pine - 85%, av. ht. 18m, dia.20 cm. white spruce 15%, ht. 15m, dia. 15 cm. understory - alder 5% dead/dry	- white, clean, wet, coarse grained. no base
	JP-00-3	12-Mar-00	6345913 N 478532 E	0.196	30.6	59.8	- canopy 80%, jack pine -100%, av. ht. 14m, dia. 10 cm. understory - birch/alder 30% low creeping berry/dead wood	- white, crust on top, wet and coarse grained
	JP-00-4	12-Mar-00	6342862 N 474290 E	0.153	33.9	52.0	- canopy 80%. jack pine - 80%, ht. 22m, dia. 25 cm. aspen 20%, ht 20m, dia.10 cm. understory - ledum, moss and wild rose	- white, wet, coarse grained

**Table II-2 Summary of 1999 Snow Course Survey Data**

Terrain Type	Survey Plot No	Date of Survey	GPS Location	Snow Density (g/cm <sup>3</sup> )	Snow Depth (cm)	Snow Water Equivalent (mm)	Description of Vegetation	Snow Cover Appearance
flat low lying	FL99-1	15-Mar-99	6345649 N 477842 E	0.178	36.9	65.6	- 80% covered with willow av. ht. 2.5m	- white, wet, loose coarse grained
	FL99-2	16-Mar-99	6351787 N 476015 E	0.175	33.5	58.8	- understory of willow (5m tall) 80% understory - dead willow and grass	- white, dry, 2 cm crust on top, loose, coarse grained
	FL99-3	16-Mar-99	6345664 N 469948 E	0.204	33.9	69.0	- understory willow (3m tall) 80% tall dead tree - 2%, tamarack 18%	- dust on surface, wet, compact, granular
	FL99-4	17-Mar-99	6339360 N 463875 E	0.191	34.6	66.3	- canopy 30%, spruce 5m ht. willow 2m ht. mosses and willow 40% cover understory	- white, clean, crust on top, coarse grained
open land	OP99-2	15-Mar-99	6344064 N 475112 E	0.140	36.2	50.7	- previously cleared area berry 70%, alder 10%	- white, clean, wet, medium to coarse grained

**APPENDIX III**

**CLIMATIC AND HYDROLOGIC MONITORING STATION  
FACTSHEETS**

# AURORA CLIMATE STATION

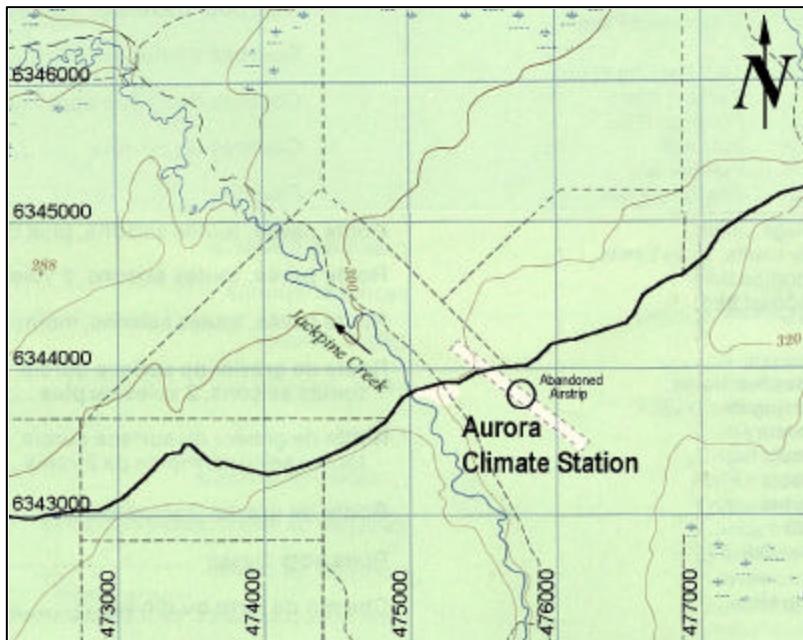

## C1

### FACTSHEET

#### LOCATION AND PURPOSE

Established in May, 1995 to monitor climate conditions in the Muskeg River basin. Formerly Station 271 for the OSLO project – 1988 data available.

Access: 400 m long 4WD track south of 2WD road  
Benchmark: n/a  
Elevation: 310 m  
Coordinates: UTM: 475800 E, 6343750 N      Lat/Long: 57°14'16" N, 111°24'27" W  
LSD: SW-16-95-9-W4      NTS Map: 74E/3

#### EQUIPMENT

Component	Function	Serial No.
Young 05103-10 Wind Monitor*	Measure wind speed and direction	Sensor 1: WM20208 Sensor 2: WM39214
LI-COR LI200S Silicon Pyranometer*	Measure solar radiation	Sensor 1: PY22490 Sensor 2: PY34148
Vaisala HMP35/45C Temperature and Relative Humidity Sensor with 41002 Radiation Shield*	Measure temperature and relative humidity	HMP35C: C1419 HMP45C: C1119
Hydrological Services TBS Tipping Bucket Rain Gauge	Measure rainfall rate (Summer)	
Texas Electronics TE-525USW Tipping Bucket Rain Gauge With CS-705 Snowfall Adapter	Measure snowfall rate (Winter)	24792-999
Campbell Scientific SR50-45 Sonic Ranger	Measure snowfall accumulation	C1035
Campbell Scientific CR10 Data Logger	Record data	
Campbell Scientific SM192 Storage Module	Store data	Module 1: Module 2: 12367
MSX20 20 Watt Solar Panel with BP12PS 12 A-h 12 VDC Rechargeable Battery and CH12R 12 VDC Charger/Regulator	Power supply	

\* Spares are available for these components to facilitate regular servicing/calibration. One sensor is deployed at any given time. Other components can be serviced seasonally.

# ALSANDS DRAIN HYDROMETRIC STATION

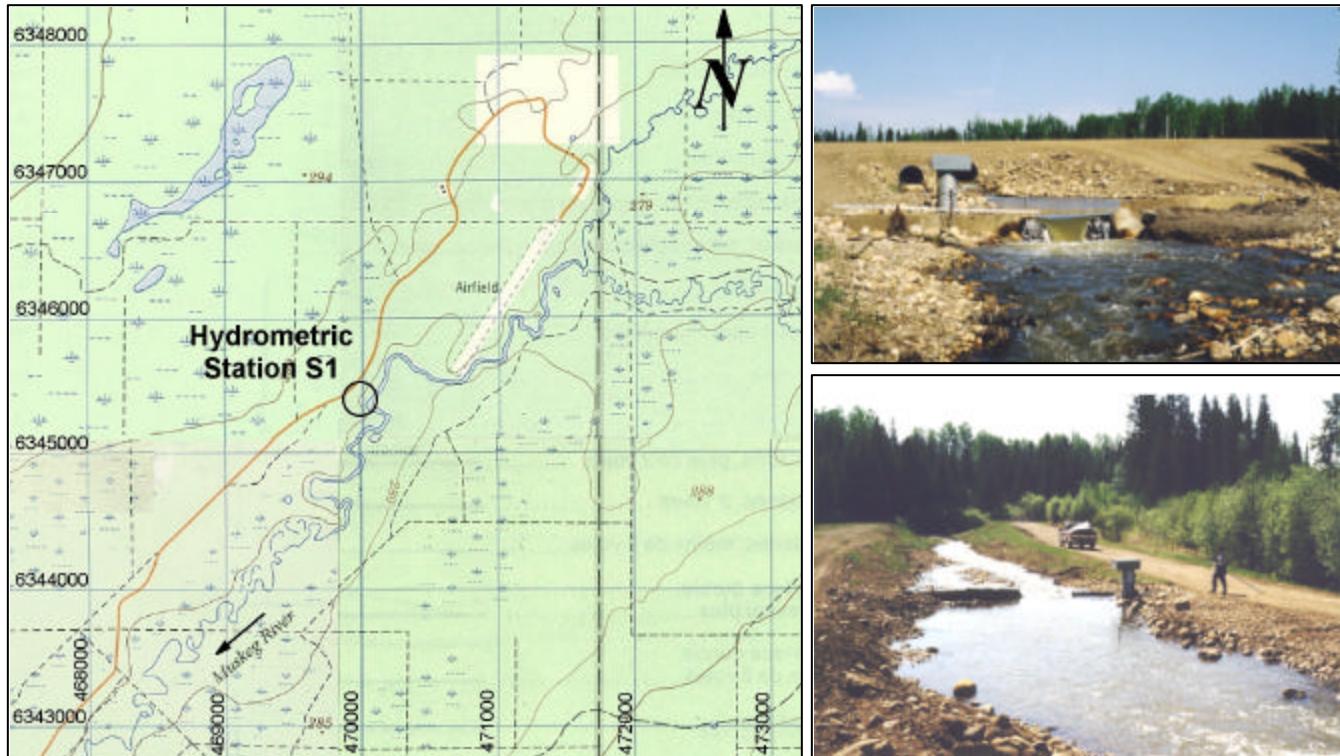

S1

FACTSHEET

## LOCATION AND PURPOSE

Established in August, 1995 to monitor discharge from the Alsands settling pond. Reinstalled with new weir by Syncrude in September, 1998 on new outlet channel.

Access: 2WD road access through Muskeg River Mine  
Benchmark: Top of pile support on right hand side of weir, elevation 280.015 m (geodetic)  
Drainage Area: 15.8 km<sup>2</sup>  
Coordinates: UTM: 470006 E, 6345534 N      Lat/Long: 57°15'12" N, 111°29'52" W  
LSD: SE-23-95-10-W4      NTS Map: 74E/6

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-E	Record data	94908-08
Keller 8363K 8 psi Pressure Transducer	Measure water levels	971021

# JACKPINE CREEK HYDROMETRIC STATION

**S2**  
**FACTSHEET**

## LOCATION AND PURPOSE

Established in May, 1995 to monitor discharge on Jackpine Creek upstream of the Muskeg River. Replaced a Water Survey of Canada gauging station (07DA009) that previously operated at the original site from 1975 to 1993. Station was moved to present location in 2000 to allow road access and avoid beaver dams.

Access: Helicopter  
Benchmark: Present Location: Steel bar in PVC housing, elevation 297.99 m (geodetic).  
Old Location: Brass cap in concrete base of cableway anchor, elevation 280.98 m (geodetic); 99.640 m (local)  
Drainage Area: 358 km<sup>2</sup>  
Coordinates: UTM: 475132 E, 6343680 N      Lat/Long: 57°14'21" N, 111°24'53" W  
              LSD: SE-17-95-9-W4      NTS Map: 74E/3  
Old Coordinates: UTM: 471952 E, 6346165 N      Lat/Long: 57°15'31" N, 111°27'55" W  
              LSD: NW-19-95-9-W4      NTS Map: 74E/6

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-1A	Record data	94834-08
Keller 8363K 8 psi Pressure Transducer	Measure water levels	971024

# IYINIMIN CREEK HYDROMETRIC STATION

**S3**  
**FACTSHEET**

## LOCATION AND PURPOSE

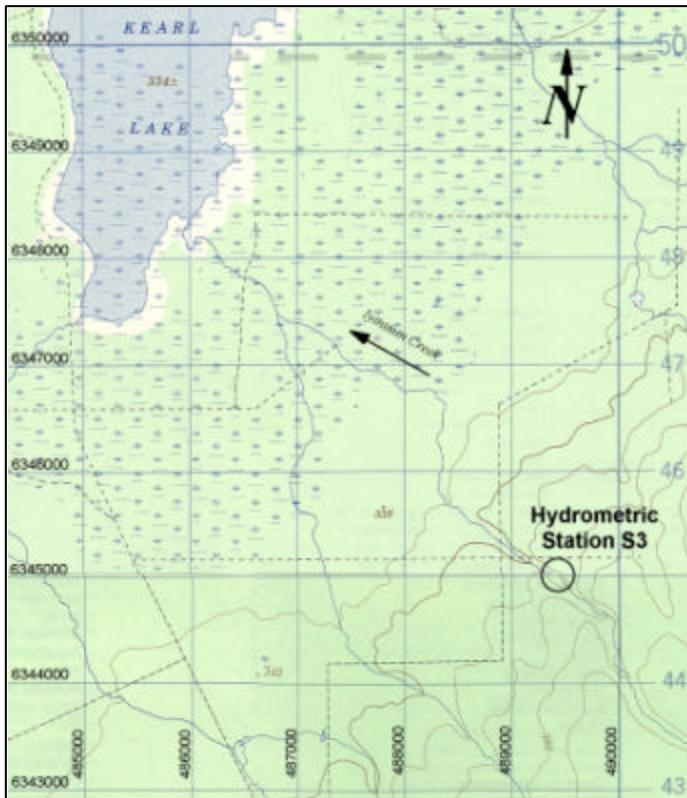

Established in May, 1995 to monitor discharge on Iyinimin Creek upstream of Kearn Lake. A rain gauge was added to the station in 1998. This station was taken out of service at the end of 1999 and may be reactivated in advance of local lease development.

Access: Helicopter

Benchmark: Rebar in 100 mm PVC housing, elevation 360.61 m (geodetic)

Drainage Area: 32.3 km<sup>2</sup>

Coordinates: UTM: 489491 E, 6345029 N      Lat/Long: 57°15'00" N, 111°10'27" W  
LSD: NE-14-95-8-W4      NTS Map: 74E/6

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-1A	Record data	41174-08
Keller 8363K 8 psi Pressure Transducer	Measure water levels	971025
Lakewood RG-306 Tipping Bucket Rain Gauge	Measure rainfall	69127

# BLACKFLY CREEK HYDROMETRIC STATION

**S4**  
**FACTSHEET**

## LOCATION AND PURPOSE

Established in May, 1995 to monitor discharge on Blackfly Creek, which is an upland tributary of the Muskeg River. The station was operated until 1998 and may be recommissioned at a future date.

Access: Helicopter

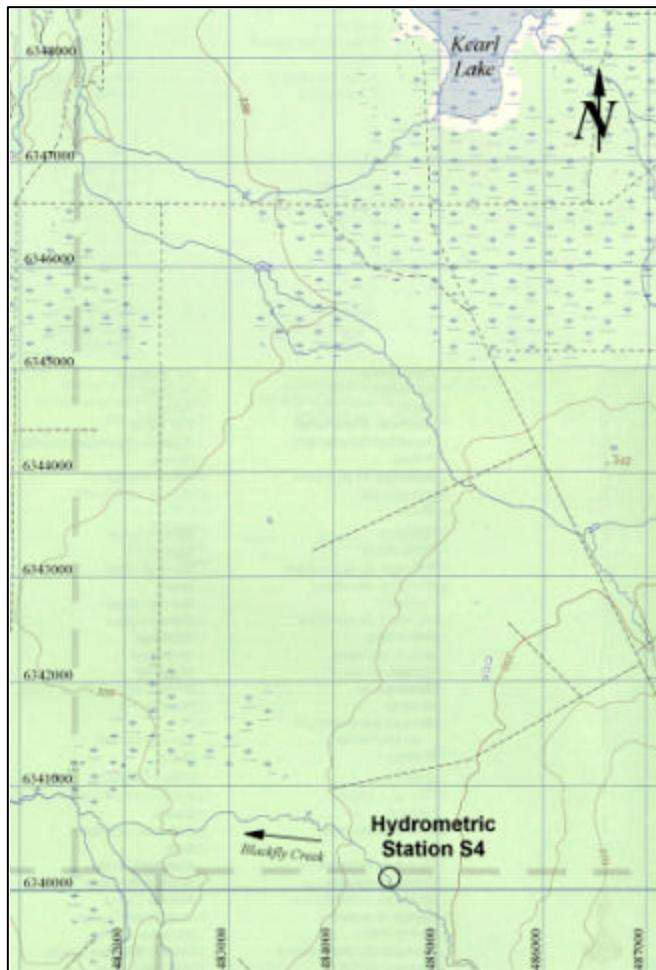

Benchmark: Rebar in 100 mm PVC housing, elevation 340.16 m (geodetic)

Drainage Area: 31.1 km<sup>2</sup>

Coordinates: UTM: 484469 E, 6340172 N      Lat/Long: 57°12'20" N, 111°15'22" W

LSD: NW-32-94-8-W4

NTS Map: 74E/3

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-2	Record data	94834-08
Keller 8363K 8 psi Pressure Transducer	Measure water levels	971022

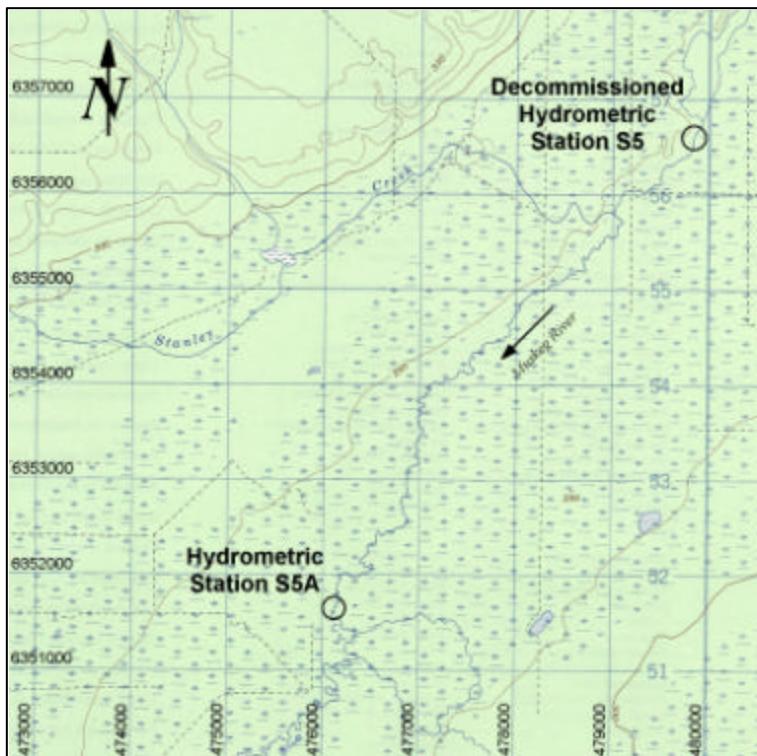

# MUSKEG RIVER AURORA HYDROMETRIC STATION

## S5A FACTSHEET

### LOCATION AND PURPOSE

Established in August, 1995 to monitor discharge on the Muskeg River upstream of disturbed watersheds. The station was relocated in 1998 to allow road access.

Access: 2WD road via the Syncrude Aurora mine site  
Benchmark: Present Location: Rebar in 100 mm PVC housing, elevation 282.38 m (geodetic)  
Old Location: Iron cap below ground surface, elevation 285.25 m (geodetic)  
Drainage Area: 552 km<sup>2</sup> (was 390 km<sup>2</sup> until 1998)  
Coordinates: UTM: 6351600 N, 476100 E Lat/Long: 57°18'30" N, 111°23'43" W  
LSD: SE-9-96-9-W4 NTS Map: 74E/6  
Old Coordinates: UTM: 6356600 N, 479850 E Lat/Long: 57°21'11" N, 111°20'03" W  
LSD: SE-26-96-9-W4

### EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-1A	Record data	95185-05
Keller 8363K 8 psi Pressure Transducer	Measure water levels	971023

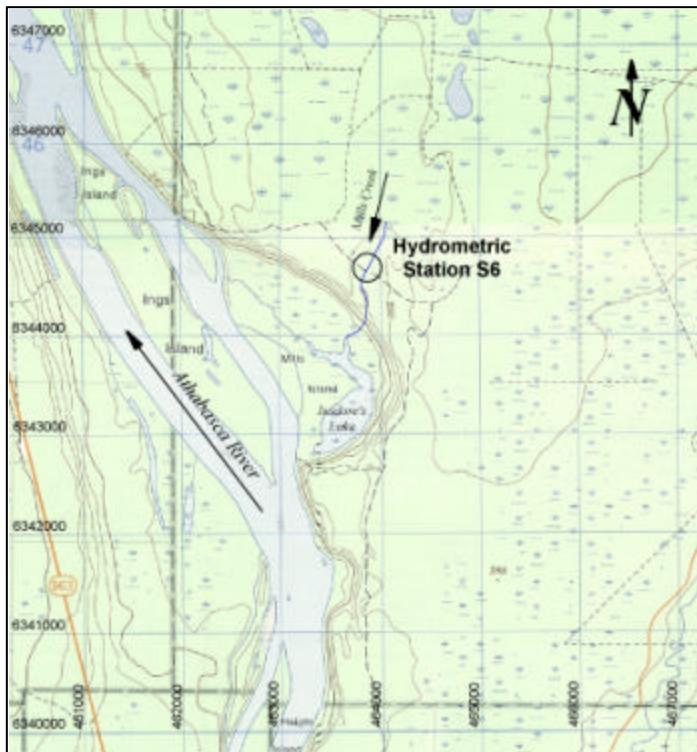

# MILLS CREEK HYDROMETRIC STATION

**S6**  
**FACTSHEET**

## LOCATION AND PURPOSE

Established in May, 1997 to monitor discharge on Mills Creek upstream of Isadore's Lake.

Access: 2WD road access along start of Ft. Chipewyan winter road  
Benchmark: Rebar in 100 mm PVC housing, elevation 273.60 m (geodetic)  
Drainage Area: 23.8 km<sup>2</sup>  
Coordinates: UTM: 463829 E, 6344743 N      Lat/Long: 57°14'44" N, 111°35'57" W  
LSD: NW-17-95-10-W4      NTS Map: 74E/4

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-1A	Record data	703126
Keller 8363K 3 psi Pressure Transducer	Measure water levels	97610

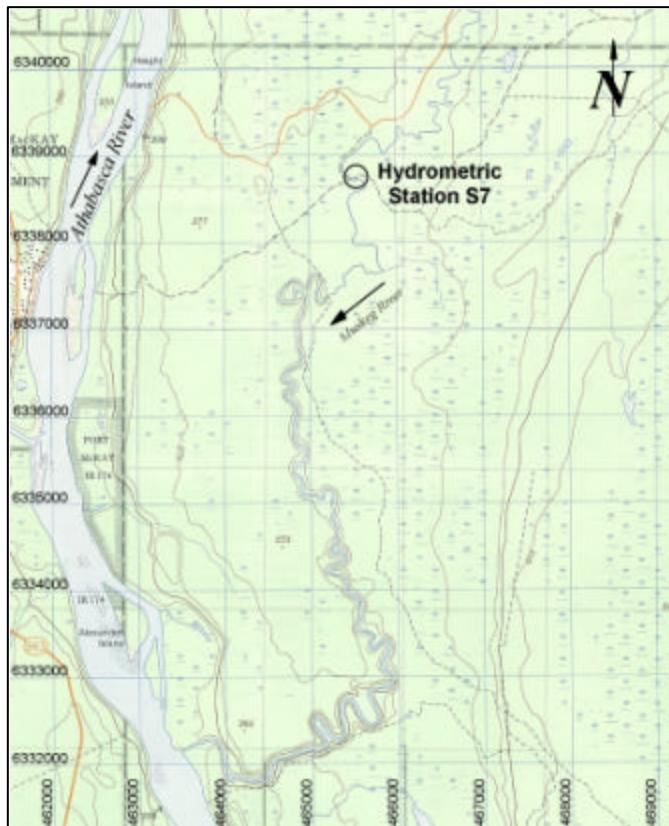

# MUSKEG RIVER WSC HYDROMETRIC STATION

S7  
FACTSHEET

## LOCATION AND PURPOSE

Established in October, 1999 to monitor winter discharge on the Muskeg River at the Water Survey of Canada gauging station 07DA008. The WSC station has operated since 1975 but discharges are only published for the March-October period.

Access: Footpath access from spur road (approximately 400 m walk, all-weather)  
Benchmark: Unhoused temporary rebar, elevation 273.72 m (geodetic)  
Drainage Area: 1460 km<sup>2</sup>  
Coordinates: UTM: 6338750 N, 465550 E      Lat/Long: 57°11'29" N, 111°34'10" W  
              LSD: SE-32-94-10-W4      NTS Map: 74E/4

## EQUIPMENT

Component	Function	Serial No.
Solinst Levelogger M5 #3001 L*	Measure and record water levels	4414

\* This unit does not compensate for variations in atmospheric pressure and data must be processed using barometric data from a nearby local station

# STANLEY CREEK HYDROMETRIC STATION

**S8**  
**FACTSHEET**

## LOCATION AND PURPOSE

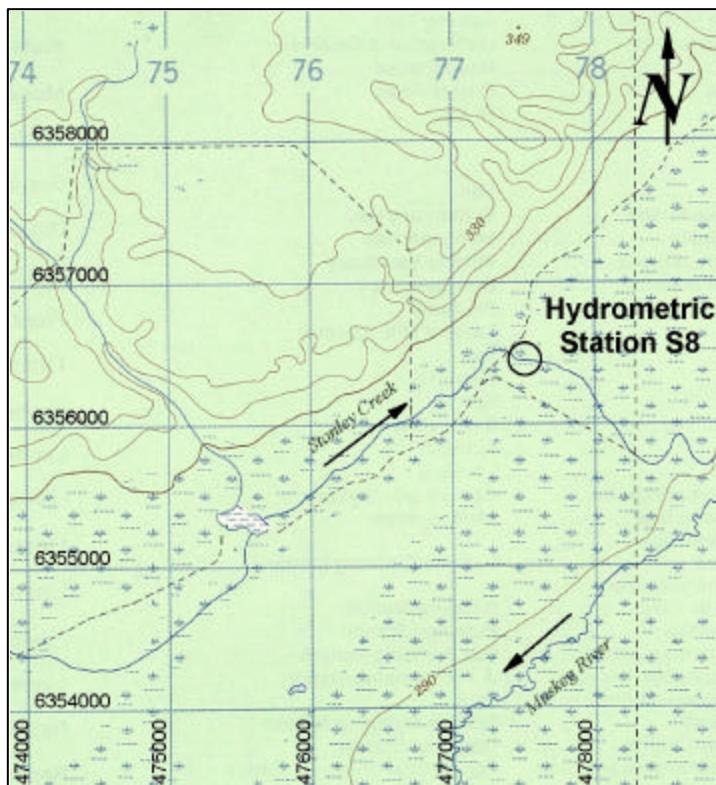

Established in September, 1999 to monitor discharges on Stanley Creek upstream of the Muskeg River. The creek has an ill-defined channel flowing through muskeg, so the water level is currently monitored, but discharges cannot be calculated without a well-defined rating curve.

Access: Helicopter

Benchmark: Rebar in PVC housing, elevation 292.15 m (geodetic)

Drainage Area: 71.8 km<sup>2</sup>

Coordinates: UTM: 477500 E, 6356450 N      Lat/Long: 57°21'06" N, 111°22'26" W  
LSD: NW-22-96-9-W4      NTS Map: 74E/6

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-2	Record data	96303-02
Keller LE8363K 2 psi Pressure Transducer	Measure water level	964165

# KEARL LAKE OUTLET HYDROMETRIC STATION

S9

FACTSHEET

## LOCATION AND PURPOSE

Established in March, 1998 to monitor discharge on the Kearl Lake Outlet channel. The station is located just upstream of a twin culvert installation. This station was taken out of service at the end of 1999 and may be reactivated in advance of local lease development. The barometric sensor is currently deployed at the Aurora Climate Station (C1).

Access: 2WD road

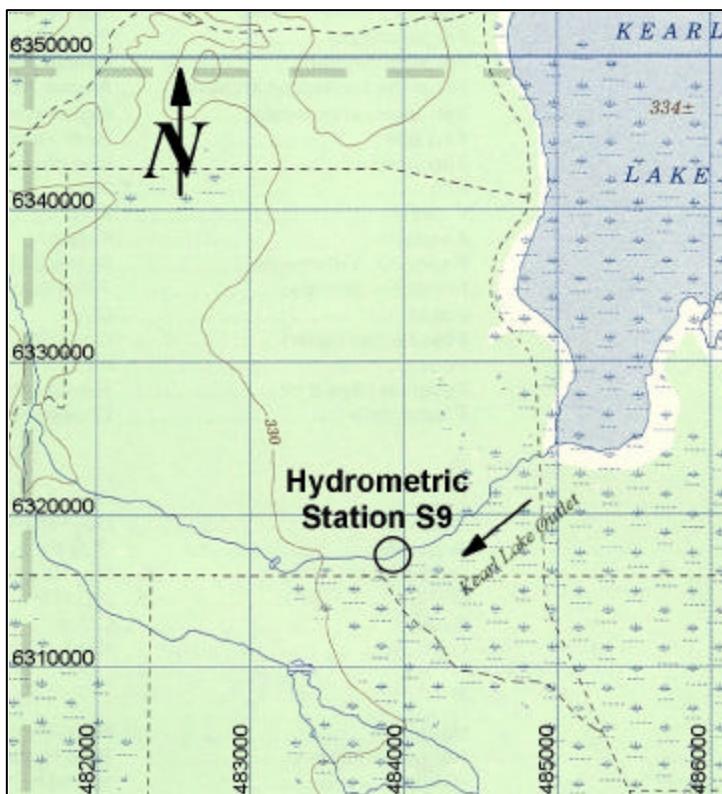

Benchmark: Rebar in PVC housing, elevation 330.40 m (geodetic)

Drainage Area: 73.6 km<sup>2</sup>

Coordinates: UTM: 483980 E, 6346750 N Lat/Long: 57°15'57" N, 111°15'57" W

LSD: SE-29-95-8-W4

NTS Map: 74E/6

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-2	Record data	701010
Keller LE8363K 4 psi Pressure Transducer	Measure water level	964638
Vaisala PTB 101B Barometric Sensor	Measure atmospheric pressure	

# WAPASU CREEK HYDROMETRIC STATION

**S10**  
**FACTSHEET**

## LOCATION AND PURPOSE

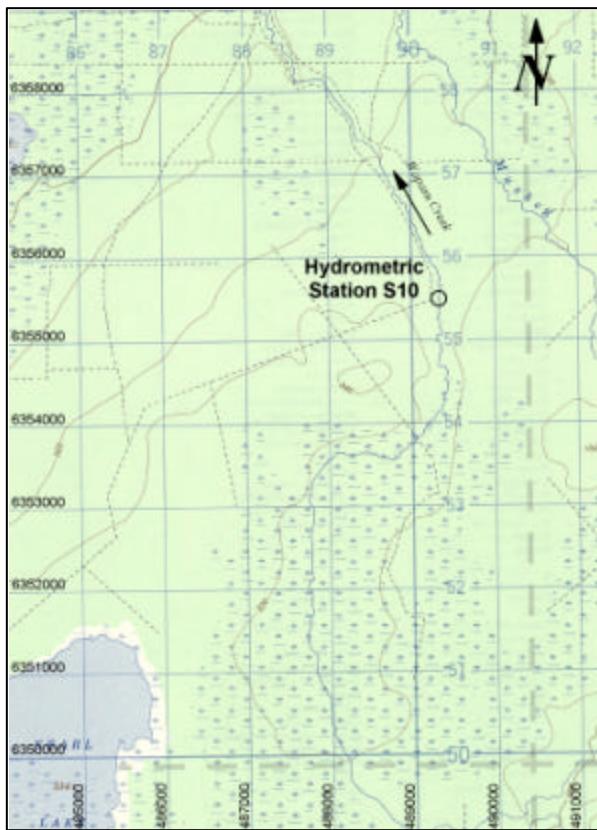

Established in May, 1997 to monitor discharge on Wapasu Creek upstream of the Muskeg River. The station was reinstalled in 1999 to ensure that low water levels could be measured. This station was taken out of service at the end of 1999 and may be reactivated in advance of local lease development.

Access: 2WD road access

Benchmark: Rebar in PVC housing, elevation 320.16 m (geodetic)

Drainage Area: 90.7 km<sup>2</sup>

Coordinates: UTM: 490350 E, 6355500 N      Lat/Long: 57°20'35" N, 111°09'40" W  
LSD: NW-24-96-8-W4      NTS Map: 74E/6

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-1A	Record data	41036-08
Keller 8363K 4 psi Pressure Transducer	Measure water levels	964640

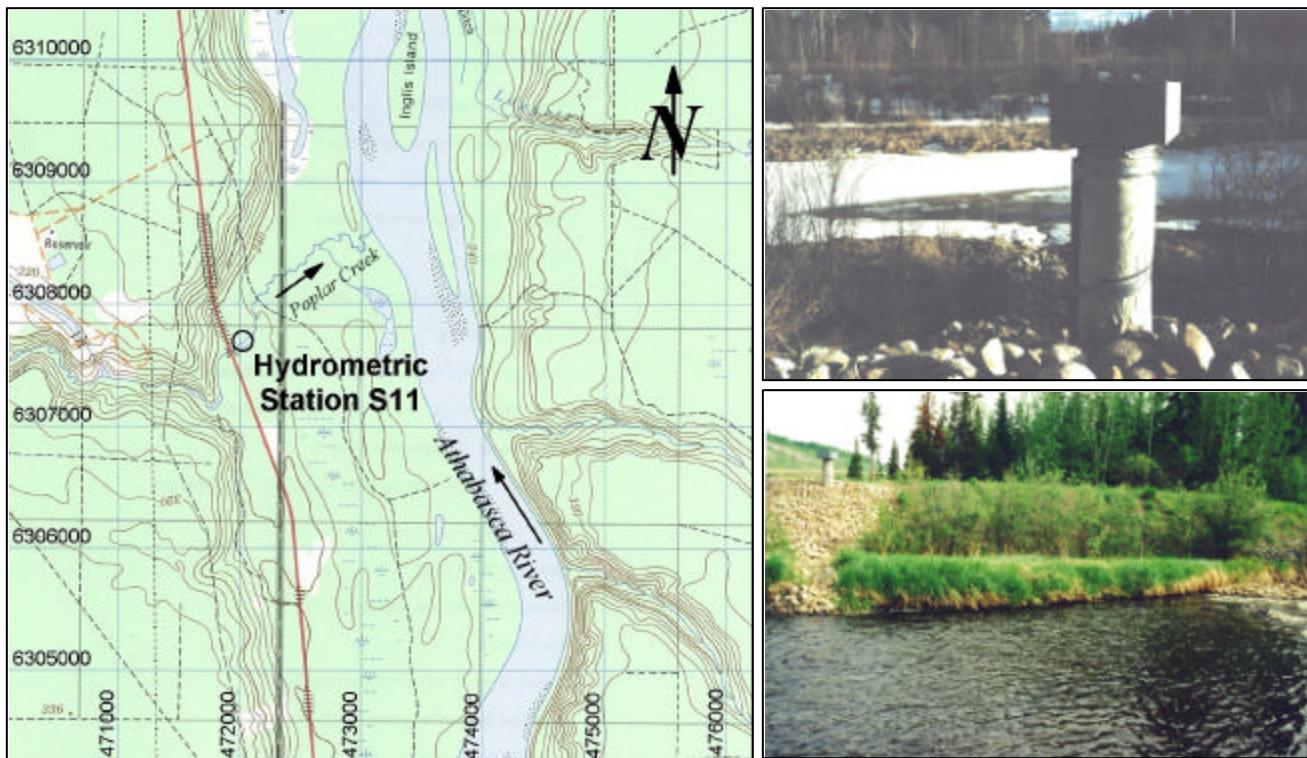

# POPLAR CREEK HYDROMETRIC STATION

**S11**  
**FACTSHEET**

## LOCATION AND PURPOSE

Established in May, 1997 to monitor discharge on Poplar Creek upstream of the Athabasca River. The station is at the site of a Water Survey of Canada gauging station (07DA007) that operated from 1973 to 1986.

Access: 2WD access on Hwy 63  
Benchmark: Brass cap on southeast bridge abutment, elevation 245.55 m (geodetic)  
Drainage Area: 422 km<sup>2</sup>  
Coordinates: UTM: 472000 E, 6307650 N      Lat/Long: 56°54'46" N, 111°27'44" W  
LSD: NE-24-91-19-W4      NTS Map: 74D/14

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-1A	Record data	41157-08
Keller 8363K 6 psi Pressure Transducer	Measure water levels	971889

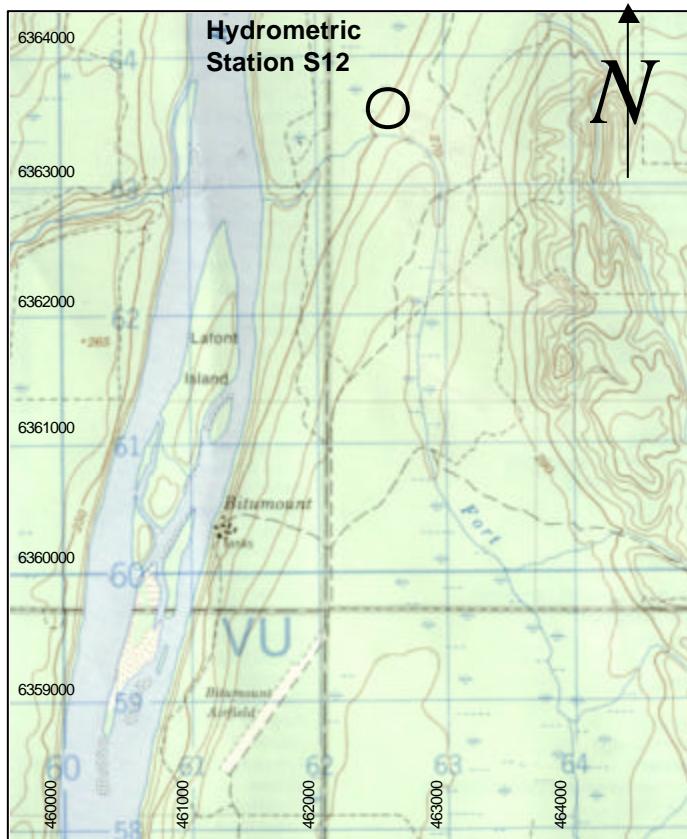

# FORT CREEK HYDROMETRIC STATION

**S12**  
**FACTSHEET**

## LOCATION AND PURPOSE

Established in May, 2000 to monitor discharge on Fort Creek upstream of the Athabasca River. The station is located just downstream of the Ft. Chipewyan winter road.

Access: 2WD road access along start of Ft. Chipewyan winter road  
Benchmark: Temporary benchmark nail in tree, elevation 253.44 m (geodetic).  
Alternative benchmark top of bolt at d/s end of culvert, elevation 253.80 m (geodetic).  
Drainage Area: 45.6 km<sup>2</sup>  
Coordinates: UTM: 462600 E, 6363400 N      Lat/Long: 57°24'48" N, 111°37'18" W  
LSD: SW-18-97-10-W4      NTS Map: 74E/5

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-1	Record data	703013
Keller 8363K 10 psi Pressure Transducer	Measure water levels	971332

# ALBIAN POND #3 OUTLET HYDROMETRIC STATION

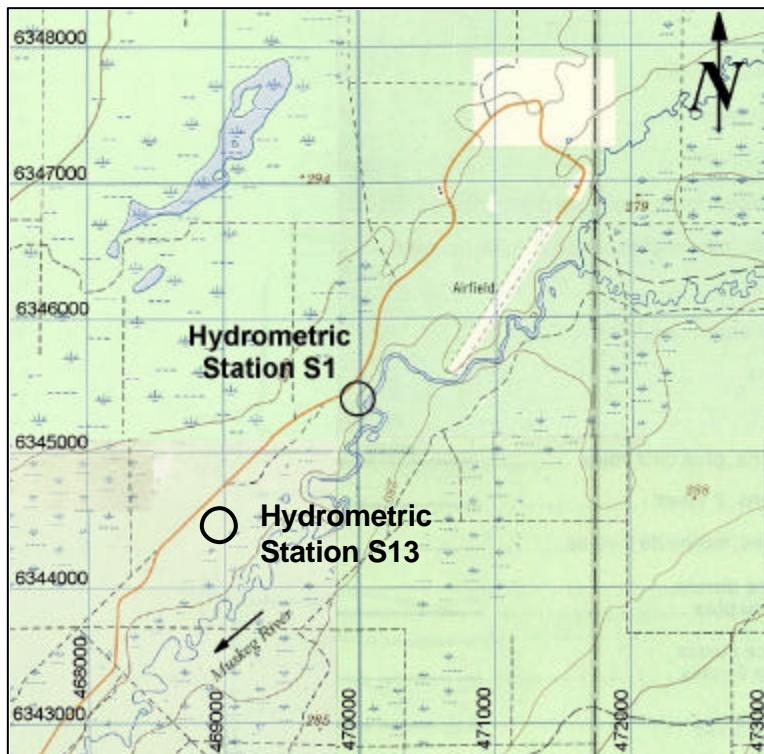

## S13

### FACTSHEET

#### LOCATION AND PURPOSE

Established in March, 2000 to monitor discharge from Albian Sands Polishing Pond #3. The outlet is routed through an engineered channel and has a 135° V-notch weir installed.

Access: 2WD from Muskeg River Mine access road  
Benchmark: Top of pile support on right hand side of weir, elevation 279.59 m (geodetic)  
Drainage Area: Mine drainage; disturbed area subject to diversions  
Coordinates: UTM: 468854 E, 6344688 N      Lat/Long: 57°14'47" N, 111°30'58" W  
LSD: NW-14-95-10-W4      NTS Map: 74E/4

#### EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-1	Record data	
Keller 8363K 10 psi Pressure Transducer	Measure water levels	996022

# McCLELLAND LAKE HYDROMETRIC STATION

L1

FACTSHEET

## LOCATION AND PURPOSE

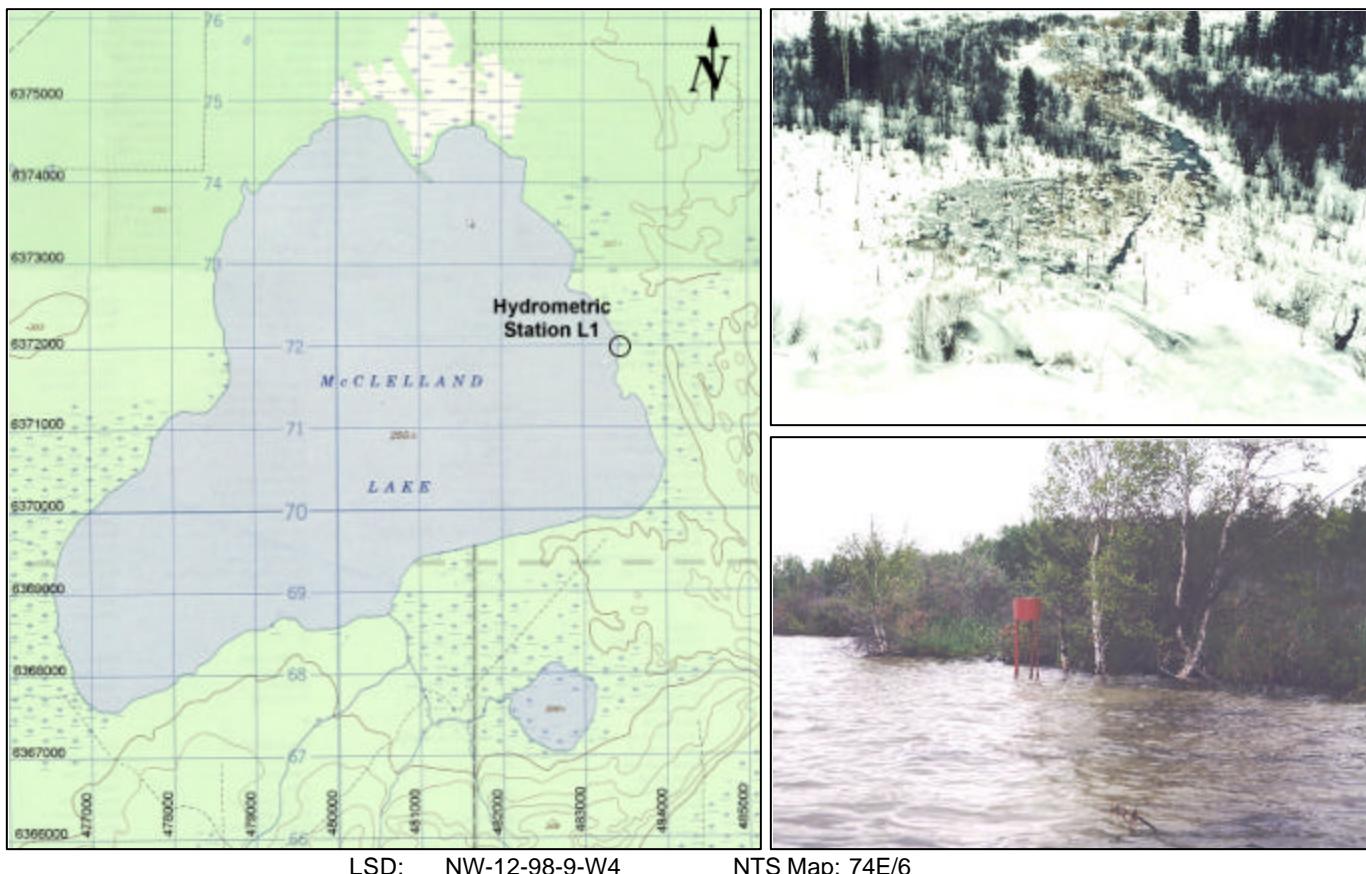

Established in July, 1997 to monitor water levels on McClelland Lake. Discharges from the lake outlet channel are also measured to construct a stage-discharge rating curve and a continuous record of discharge is thus derived.

Access: Helicopter

Benchmark: Rebar in PVC housing, elevation 295.84 m (geodetic)

Drainage Area: 191 km<sup>2</sup>

Coordinates: UTM: 483430 E, 6371950 N Lat/Long: 57°29'30" N, 111°16'37" W

## EQUIPMENT

Component	Function	Serial No.
Lakewood UltraLogger RX-2	Record data	703013
Keller 8363K 10 psi Pressure Transducer	Measure water levels	971332

# KEARL LAKE HYDROMETRIC STATION

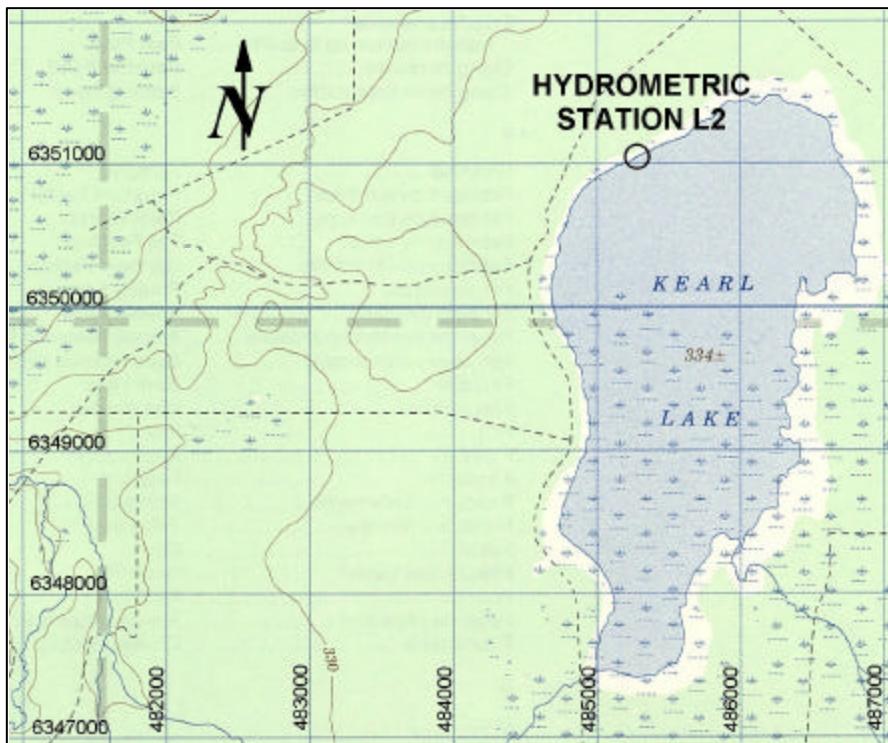

L2

FACTSHEET

## LOCATION AND PURPOSE

Established in April, 1999 to monitor water levels on Kearl Lake.

Access: 4WD road access  
Benchmark: Rebar in PVC housing, elevation 333.41 m (geodetic)  
Drainage Area: 72.6 km<sup>2</sup>  
Coordinates: UTM: 485250 E, 6351050 N      Lat/Long: 57°18'15" N, 111°14'40" W  
LSD: NW-4-96-8-W4      NTS Map: 74E/6

## EQUIPMENT

Component	Function	Serial No.
Solinst Levelogger F15/M5 #3001 LT*	Measure and record water level and temperature	4307

\* This unit does not compensate for variations in atmospheric pressure and data must be processed using barometric data from a nearby local station

# ISADORE'S LAKE HYDROMETRIC STATION

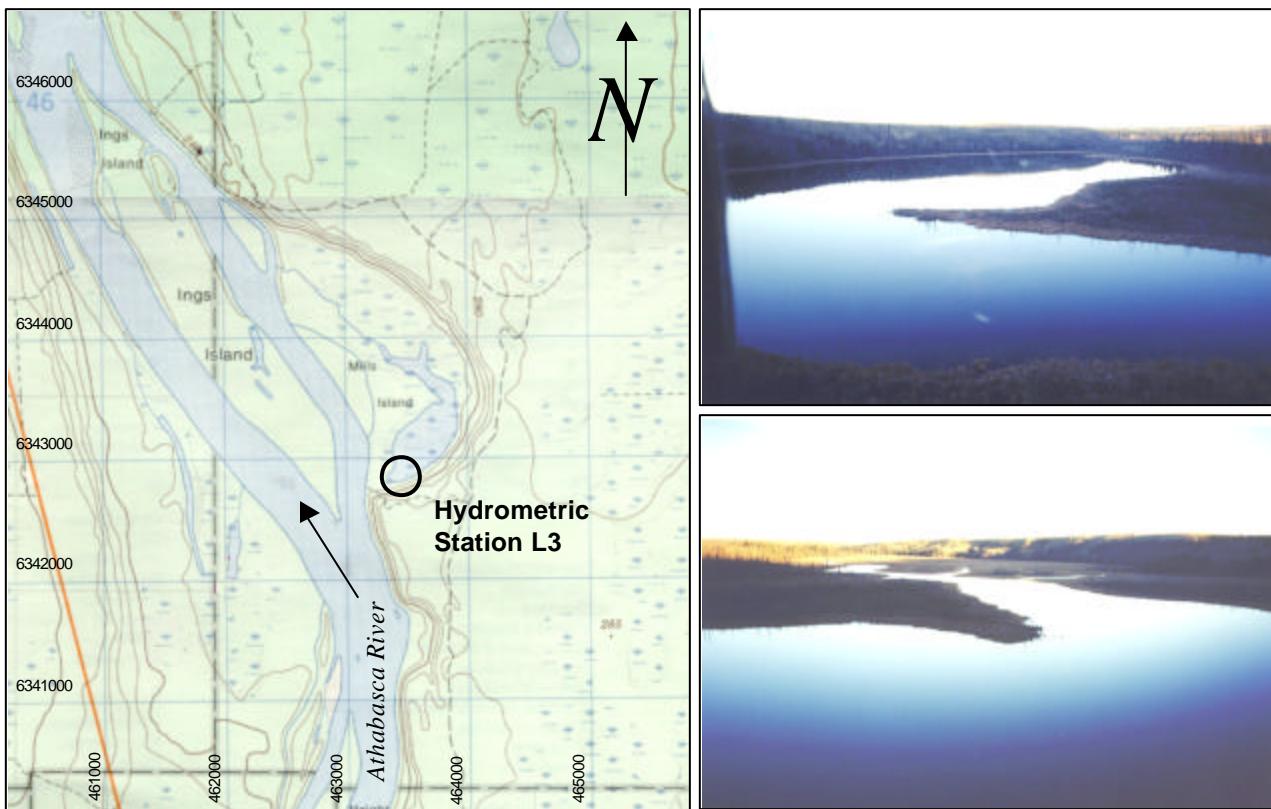

L3

FACTSHEET

## LOCATION AND PURPOSE

Established in February 2000 to monitor water levels on Isadore's Lake.

Access: 4WD road access off Ft. Chipewyan winter road; foot access down slope  
Benchmark: Temporary benchmark nail in tree, elevation 235.91 m (geodetic)  
Drainage Area: 28.0 km<sup>2</sup>  
Coordinates: UTM: 6343250 N, 463400 E      Lat/Long: 57°13'58" N, 111°36'24" W  
LSD: 16-7-95-10-W4      NTS Map: 74E/4

## EQUIPMENT

Component	Function	Serial No.
Solinst Levelogger LT*	Measure and record water levels	

\* This unit does not compensate for variations in atmospheric pressure and data must be processed using barometric data from a nearby local station

## **APPENDIX IV**

### **2000 MANUAL DISCHARGE MEASUREMENTS FOR DEVELOPING STAGE-DISCHARGE RATING CURVES AT HYDROLOGIC STATIONS**

**Table IV-1 Summary of 2000 Manual Discharge Measurements**

Station No.	Stream Name	Winter Discharge (m³/s)	Date	Snowmelt Discharge (m³/s)	Date	Summer Discharge (m³/s)	Date

							<b>0.209</b>	

- Note: 1. Water was flowing from the 12 inch outfall pipe into the drain.  
 2. TSS sample taken.  
 3. Discharge measured downstream of the weir.  
 4. Downloaded data from the datalogger.  
 5. The old B.M (original B.M. used by Agra) was destroyed - noticed a path was made by dozer through the B.M. location.  
 6. A new B.M. (top of the weir plate R.H.S. marked) was established to measure the water level.

- Note:
1. Transducer and logger were still temporary installed.
  2. Water sample was collected for TSS.
  3. Data was downloaded and surveyed the water level.
  4. Construction of the road near the bridge in progress - informed by Contractor the bridge will be completed within 3 to 4 weeks.

								<b>0.011</b>

Note: 1. Ice cover was broken up where discharge was measured - water was flowing underneath the ice at downstream.

2. Water was flowing freely over the weir.

**APPENDIX V**  
**STAGE-DISCHARGE RATING CURVES**

**UPDATED STAGE-DISCHARGE RATING CURVES**

Most stage-discharge rating curves were updated in 2000 to consider new data and to accommodate the tying-in of local, permanent benchmarks to geodetic elevations. A summary of benchmark elevations and locations is provided in the following table. The datum for each station is arbitrarily selected and referenced to the geodetic benchmark elevation.

Station	Benchmark Elevation (m)	Benchmark Location
S1 – Alsands Drain	280.015	right weir support adjacent to V-notch
S2 – Jackpine Creek	297.990	steel rod in PVC housing on right bank
S3 – Iyinimin Creek	360.610	steel rod in PVC housing on right bank
S4 – Blackfly Creek	340.160	steel rod in PVC housing on left bank
S5A – Muskeg River Aurora	282.380	steel rod in PVC housing on right bank
S6 – Mills Creek	273.600	steel rod in PVC housing on right bank
S7 – Muskeg River WSC	273.720	steel rod on right bank
S8 – Stanley Creek	292.150	steel rod in PVC housing near chopper pad
S9 – Kearl Lake Outlet	330.400	steel rod in PVC housing on right bank
S10 – Wapasu Creek	320.160	steel rod in PVC housing on right bank
S11 – Poplar Creek	245.550	ASCM cap on southeast bridge abutment
S12 – Fort Creek	253.440	nail in tree on left bank (temporary)
S13 – Albian Pond #3	279.590	right weir support adjacent to V-notch
L1 – McClelland Lake	295.840	steel rod in PVC housing at treeline to southeast
L2 – Kearl Lake	333.410	steel rod in PVC housing at treeline to west
L3 – Isadore's Lake	235.910	nail in tree to south (temporary)

Attention: Mr. Barry Wolsey, Law Dept

Dear Sir:

**RE: Licence of Occupation Application No. LOC 001053**

**Pt. LSD 09-07-095-10-W4**

**Water Level Monitoring Station (Kearl Lake) *Creeburn Lake***

**LETTER OF AUTHORITY**

Further to your application dated May 8, 2000, this is to advise that the department has completed its review of your request.

Pursuant to Section 19 of the Public Lands Act, authority is hereby granted to enter upon those portions of vacant or other public lands for which you have obtained the occupant's consent, the approximate location of which is shown on the attached plan, for the purpose of a **water level monitoring station**, subject to the conditions in Schedule A, attached.

Based on the information supplied with your application, first year's charges for this authority are indicated below. Please remit this amount within 30 days. This account will be subject to a 12% interest charge if payment is not received within specified.

.../2

**(CONDITIONS) SCHEDULE A**

1. 001      **IN THIS DOCUMENT**, unless the context indicates otherwise:

"**approval (of a departmental officer)**" whenever required, must be in writing.

"**authority**" means: this document or the right to occupy public land granted by this document.

"**department**" means:

Department of Alberta Environment  
Land and Forest Service  
Land Administration Division  
Petroleum Plaza, South Tower  
3<sup>rd</sup> Floor, 9915 – 108<sup>th</sup> Street  
Edmonton, Alberta  
T5K 2G8  
Telephone: (780) 427-3570

"**departmental officer**" means: an employee of the Alberta Environment, Land and Forest Service; or Alberta Agriculture, Food and Rural Development, Public Lands responsible for the management of surface activity on the land.

"**holder**" means: the recipient of the right to occupy public land granted by this document.

"**land(s)**" means: the specific land which the holder is authorized to occupy by this document.

"**minister**" means: the Minister of Alberta Environment.

payments required by this document are to be made payable to "**The Provincial Treasurer**" and may be delivered to the nearest Public Lands or Land and Forest Service office, or mailed to:

Alberta Environment  
Land and Forest Service  
Main Floor, Petroleum Plaza, South Tower  
9915 – 108<sup>th</sup> Street  
Edmonton, Alberta  
T5K 2G8

- a) The holder shall comply with all relevant laws in the Province of Alberta.
- b) A copy of this authority shall be retained on the job site during all phases of your activity, including, if applicable, preparation, construction, development, maintenance and abandonment.

- c) Schedule "B", attached lists any prior and subsisting authorizations and dispositions (prior rights) issued on the quarter sections included in this authority. The holder shall not conduct any activity on the land where prior rights have been issued without the consent of the holder of these prior rights.

Surface rights plot sheets showing dispositions listed on Schedule "B" may be viewed at, or further information obtained from, the Technical Services Branch, Land Administration Division, 2<sup>nd</sup> Floor, Petroleum Plaza, South Tower, 9915 – 108<sup>th</sup> Street, Edmonton, Alberta, T5K 2G8, Telephone (780) 427-3509, Fax (780) 422-4252.

Copies of these plots or any plan showing the location of a disposition may be purchased from IHS Energy Group, Main Floor, Petroleum Plaza, South Tower, 9915 – 108<sup>th</sup> Street, Edmonton, Alberta, T5K 2G8, Telephone (780) 413-3380, Fax (780) 413-3383.

- d) If a trapping area (TPA) is listed in Schedule "B", the holder shall contact the registered trapper at least FIVE DAYS PRIOR TO COMMENCING ANY ACTIVITY. This must be done by registered mail and we recommend personal communication follow-up. The trapper's name and address may be obtained from the Department of Energy, Calgary Information Centre, Telephone: (403) 297-6324. For other information concerning registered traplines, contact the Licencing Section, Natural Resources Service, Department of Alberta Environment, Edmonton, Alberta, Telephone: (780) 427-6729, upon receipt of this approval. The holder may be responsible for any damage to traps, snares or other improvements.
- e) This authorization should not be construed as assuring that any other relevant approvals from this Department or any other department or agency of the Alberta Government will be granted.
- f) This authorization is granted subject to further amendment by the Minister of Alberta Environment, or his designate, based upon evidence obtained from an Alberta Energy and Utilities Board hearing that relates to the subject matter of this authorization.

2. 123

The holder shall contact and advise the departmental officer of its intentions:

- prior to entry upon the lands.
- prior to any additional construction during the term of this authority.
- at the completion of operations, and
- upon abandonment of this activity or cancellation of this authority.

**Northeast Boreal  
Waterways Forest Area  
Fort McMurray Office  
Telephone: (780) 743-7120**

3. 100 Prior to the commencement of any activity, the holder shall arrange and hold a meeting with a departmental officer to discuss site specific operating conditions, which may include access, creek crossings, timber salvage and wildlife concerns.
4. 117 Prior to commencement of construction, the holder shall obtain authority under The Water Act from Natural Resources Service of Alberta Environment at Edmonton, Alberta, Telephone: (780) 427-6451.
5. 060 The holder shall within 30 days provide to the department a written consent from the following occupant(s) who hold prior legal rights:

**Disposition No. FMA 9100029**  
**Joint Venture Parties**  
**Alberta-Pacific Forest Industries Inc.**  
**c/o Evergreen Land Use Consulting**  
**Floor 2, 410 – 6<sup>th</sup> Street SW**  
**Calgary, Alberta T2P 1X2**

6. Access to the site is by foot traffic only, unless otherwise approved by a departmental officer.
7. 165 Unless otherwise approved by a departmental officer, the holder shall use only existing clearings/trails and not clear any new areas.
8. 169 The holder may not conduct any activity incidental to this authority on land not included in this authority without prior approval from a departmental officer. (A departmental officer may approve land use for incidental activities such as campsites, borrow pits, temporary access, flare pits, remote sumps, trails and other temporary uses).
9. 183 The holder shall ensure that surface disturbance is kept to a minimum.
10. 241 The holder shall dispose of all debris/waste in a manner directed by a departmental officer. ...
11. 261 Timber salvage is waived.
12. 265 The holder shall not deposit or push debris, soil or other materials into or through any watercourse or water body or on the ice of any watercourse/water body.
13. 304 The holder shall take all precautions and safeguards necessary to prevent soil/surface erosion.
14. 204 The holder shall reclaim all disturbed areas immediately after operations.

15. 065      The lease, when issued, will be for a term as indicated effective from the date of this authority. Rental will also be assessed effective from this date.

**Term: 1 year**

All licences, authorizations and approvals issued under the Alberta Environment and Enhancement Act, Water Act or Public Lands Act should not be taken to mean the proponent (applicant) has complied with federal legislation. Proponents should contact Habitat Management, Central and Arctic Region, Fisheries and Oceans, 501 University Crescent, Winnipeg, Manitoba, R3T 2N6 (phone: 204 – 984-2505) in relation to the application of federal laws relating to the Fisheries Act (Canada) and the Navigation Protection Program, Canadian Coast Guard, 201 North Front Street, Suite 703, Sarnia, Ontario, N7T 8B1 (phone: 519 – 383-1862) relating to the Navigable Waters Protection Act.

Attention: Mr. Barry Wolsey, Law Dept

Dear Sir:

**RE: Licence of Occupation Application No. LOC 001050  
Pt. LSD 12-04-096-08-W4  
Water Level Monitoring Station (Kearl Lake)  
LETTER OF AUTHORITY**

Further to your application dated May 8, 2000, this is to advise that the department has completed its review of your request.

Pursuant to Section 19 of the Public Lands Act, authority is hereby granted to enter upon those portions of vacant or other public lands for which you have obtained the occupant's consent, the approximate location of which is shown on the attached plan, for the purpose of a **water level monitoring station**, subject to the conditions in Schedule A, attached.

Based on the information supplied with your application, first year's charges for this authority are indicated below. Please remit this amount within 30 days. This account will be subject to a 12% interest charge if payment is not received within specified.

.../2

**(CONDITIONS) SCHEDULE A**

1. 001      **IN THIS DOCUMENT**, unless the context indicates otherwise:

"**approval (of a departmental officer)**" whenever required, must be in writing.

"**authority**" means: this document or the right to occupy public land granted by this document.

"**department**" means:

Department of Alberta Environment  
Land and Forest Service  
Land Administration Division  
Petroleum Plaza, South Tower  
3<sup>rd</sup> Floor, 9915 – 108<sup>th</sup> Street  
Edmonton, Alberta  
T5K 2G8  
Telephone: (780) 427-3570

"**departmental officer**" means: an employee of the Alberta Environment, Land and Forest Service; or Alberta Agriculture, Food and Rural Development, Public Lands responsible for the management of surface activity on the land.

"**holder**" means: the recipient of the right to occupy public land granted by this document.

"**land(s)**" means: the specific land which the holder is authorized to occupy by this document.

"**minister**" means: the Minister of Alberta Environment.

payments required by this document are to be made payable to "**The Provincial Treasurer**" and may be delivered to the nearest Public Lands or Land and Forest Service office, or mailed to:

Alberta Environment  
Land and Forest Service  
Main Floor, Petroleum Plaza, South Tower  
9915 – 108<sup>th</sup> Street  
Edmonton, Alberta  
T5K 2G8

- a) The holder shall comply with all relevant laws in the Province of Alberta.
- b) A copy of this authority shall be retained on the job site during all phases of your activity, including, if applicable, preparation, construction, development, maintenance and abandonment.

- c) Schedule "B", attached lists any prior and subsisting authorizations and dispositions (prior rights) issued on the quarter sections included in this authority. The holder shall not conduct any activity on the land where prior rights have been issued without the consent of the holder of these prior rights.

Surface rights plot sheets showing dispositions listed on Schedule "B" may be viewed at, or further information obtained from, the Technical Services Branch, Land Administration Division, 2<sup>nd</sup> Floor, Petroleum Plaza, South Tower, 9915 – 108<sup>th</sup> Street, Edmonton, Alberta, T5K 2G8, Telephone (780) 427-3509, Fax (780) 422-4252.

Copies of these plots or any plan showing the location of a disposition may be purchased from IHS Energy Group, Main Floor, Petroleum Plaza, South Tower, 9915 – 108<sup>th</sup> Street, Edmonton, Alberta, T5K 2G8, Telephone (780) 413-3380, Fax (780) 413-3383.

- d) If a trapping area (TPA) is listed in Schedule "B", the holder shall contact the registered trapper at least FIVE DAYS PRIOR TO COMMENCING ANY ACTIVITY. This must be done by registered mail and we recommend personal communication follow-up. The trapper's name and address may be obtained from the Department of Energy, Calgary Information Centre, Telephone: (403) 297-6324. For other information concerning registered traplines, contact the Licencing Section, Natural Resources Service, Department of Alberta Environment, Edmonton, Alberta, Telephone: (780) 427-6729, upon receipt of this approval. The holder may be responsible for any damage to traps, snares or other improvements.
- e) This authorization should not be construed as assuring that any other relevant approvals from this Department or any other department or agency of the Alberta Government will be granted.
- f) This authorization is granted subject to further amendment by the Minister of Alberta Environment, or his designate, based upon evidence obtained from an Alberta Energy and Utilities Board hearing that relates to the subject matter of this authorization.
2. 123 The holder shall contact and advise the departmental officer of its intentions:
- prior to entry upon the lands.
  - prior to any additional construction during the term of this authority.
  - at the completion of operations, and
  - upon abandonment of this activity or cancellation of this authority.

**Northeast Boreal  
Waterways Forest Area  
Fort McMurray Office  
Telephone: (780) 743-7120**

3. 100 Prior to the commencement of any activity, the holder shall arrange and hold a meeting with a departmental officer to discuss site specific operating conditions, which may include access, creek crossings, timber salvage and wildlife concerns.
4. 117 Prior to commencement of construction, the holder shall obtain authority under The Water Act from Natural Resources Service of Alberta Environment at Edmonton, Alberta, Telephone: (780) 427-6451.
5. 060 The holder shall within 30 days provide to the department a written consent from the following occupant(s) who hold prior legal rights:

**Disposition No. FMA 9100029**  
**Joint Venture Parties**  
**Alberta-Pacific Forest Industries Inc.**  
**c/o Evergreen Land Use Consulting**  
**Floor 2, 410 – 6<sup>th</sup> Street SW**  
**Calgary, Alberta T2P 1X2**

6. Access to the site is by foot traffic only, unless otherwise approved by a departmental officer.
7. 165 Unless otherwise approved by a departmental officer, the holder shall use only existing clearings/trails and not clear any new areas.
8. 169 The holder may not conduct any activity incidental to this authority on land not included in this authority without prior approval from a departmental officer. (A departmental officer may approve land use for incidental activities such as campsites, borrow pits, temporary access, flare pits, remote sumps, trails and other temporary uses).
9. 183 The holder shall ensure that surface disturbance is kept to a minimum.
10. 241 The holder shall dispose of all debris/waste in a manner directed by a departmental officer.
11. 261 Timber salvage is waived.
12. 265 The holder shall not deposit or push debris, soil or other materials into or through any watercourse or water body or on the ice of any watercourse/water body.
13. 304 The holder shall take all precautions and safeguards necessary to prevent soil/surface erosion.
14. 204 The holder shall reclaim all disturbed areas immediately after operations.

15. 065      The lease, when issued, will be for a term as indicated effective from the date of this authority. Rental will also be assessed effective from this date.

**Term: 10 years**

All licences, authorizations and approvals issued under the Alberta Environment and Enhancement Act, Water Act or Public Lands Act should not be taken to mean the proponent (applicant) has complied with federal legislation. Proponents should contact Habitat Management, Central and Arctic Region, Fisheries and Oceans, 501 University Crescent, Winnipeg, Manitoba, R3T 2N6 (phone: 204 – 984-2505) in relation to the application of federal laws relating to the Fisheries Act (Canada) and the Navigation Protection Program, Canadian Coast Guard, 201 North Front Street, Suite 703, Sarnia, Ontario, N7T 8B1 (phone: 519 – 383-1862) relating to the Navigable Waters Protection Act.

## **APPENDIX VIII**

### **BRIEF DESCRIPTION OF 2000 CLIMATIC AND HYDROLOGIC CONDITIONS INCLUDED IN RAMP REPORT**

## Brief Description of 2000 Climatic and Hydrologic Conditions Included in RAMP Report

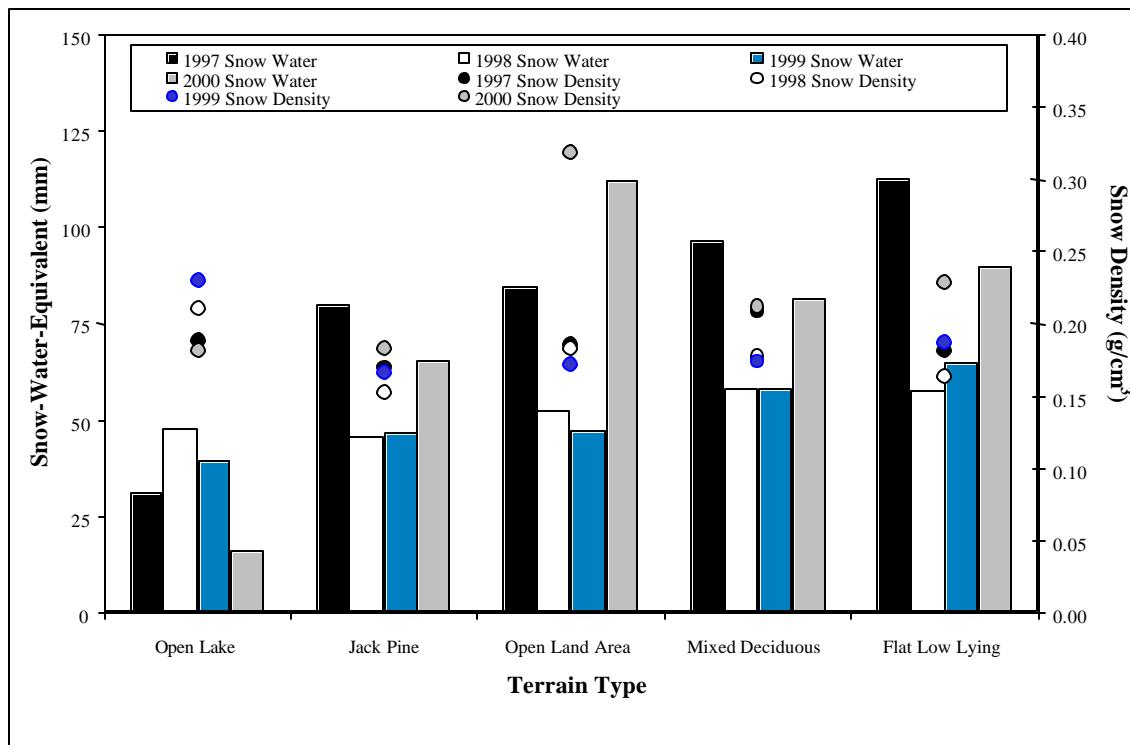

The core components of the 2000 monitoring program (water and sediment quality, benthic invertebrate communities and fish populations) are all influenced by climatic conditions. In particular, changes that alter the quantity of water in the Athabasca River, the tributaries of the Athabasca River, wetlands and lakes will influence these core components.

Monitoring of climatic and hydrologic conditions in the Oil Sands Region is accomplished via the RAMP Climatic and Hydrologic Monitoring Program. This program, which is currently supported by Syncrude, Albion, Mobil, True North, Petro Canada, and Suncor, has been in place since 1995. An annual report on the program is issued as Volume II of the 2000 RAMP report. Summaries of historical information, as well as data collected during 2000, are included in Volume II. Since changes in flows and water levels may affect both the success and the results of RAMP sampling throughout the study area, a summary of the 2000 conditions is provided as background information in this section.

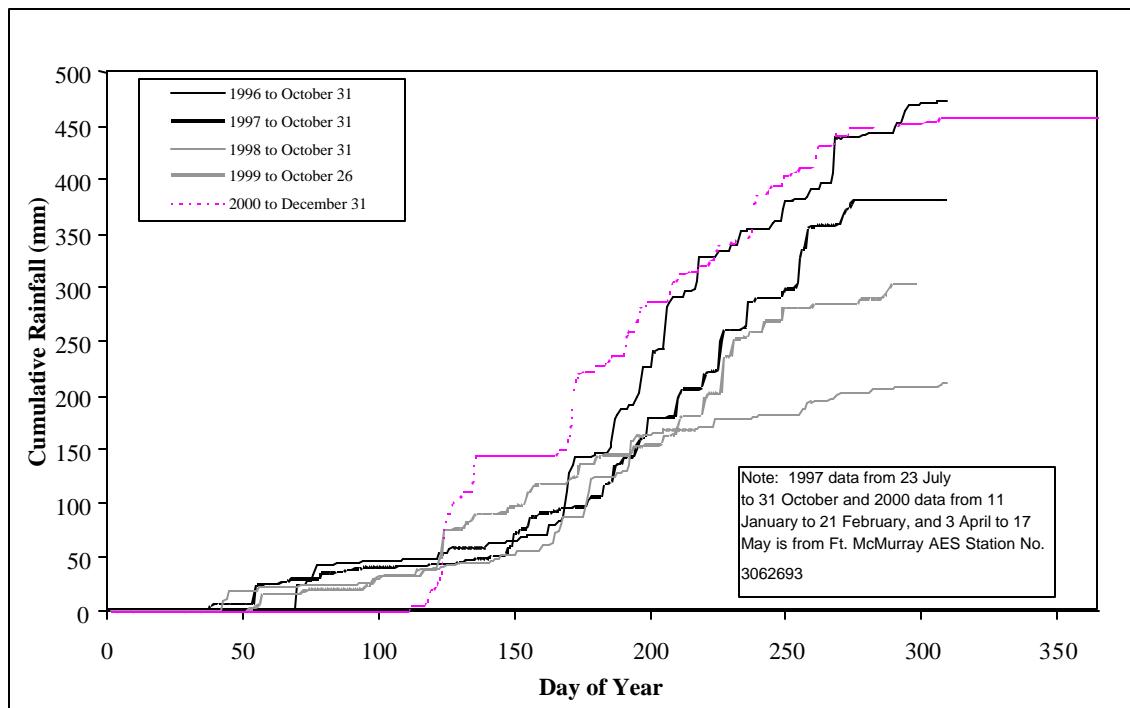

Field observations indicate that 2000 was a wetter than normal year in the Muskeg River and adjacent basins, in contrast to the dry conditions observed in 1998 and 1999. Heavy snowfall during November and December, 1999 was followed by light snowfall in early 2000. The resulting moderate snowpack (Figure VIII-1), combined with dry muskeg, produced relatively low stream discharges during snowmelt in 2000. However, significant rainfall occurred in late May and late June, as shown in Figure VIII-2. During the late June rainfall event, 63 mm of rain was measured at the Aurora Climate Station, and five-year flood events were measured on Jackpine Creek and the Muskeg and Firebag rivers. The total rainfall measured at the Aurora Climate Station in 2000 was 457 mm. This is similar to that measured in 1996 (472 mm) and significantly more than that measured in 1997, 1998 and 1999 (382 mm, 212 mm and 303 mm, respectively), as shown in Figure VIII-2.

The analysis of available data indicates that maximum daily stream discharges in 2000 were slightly higher than the long-term mean of annual maximum daily values (Table VIII-1). Minimum daily discharges were lower than the mean for most stations. Lower than normal minimum daily discharges occurred at the start of 2000 due to dry conditions occurring in 1999. The low of record on the Athabasca River, equal to the 50 year low flow, was recorded in January 2000, and a discharge equal to the 20 year low flow was recorded in the Muskeg River in January 2000. Minimum daily discharges during the latter half of 2000 were not representative of drought conditions.

**Figure VIII-1 Snow Accumulation in Muskeg River Basin, 1997 - 2000**

**Figure VIII-2 Cumulative Annual Rainfall at Aurora Climate Station, 1996 - 2000**

The cumulative flow volume for the period from March to September 2000 (i.e., spring melt to late summer) was similar to average (Table VIII-2) for local streams. However, the cumulative flow volume for the Athabasca River was the lowest recorded in 41 years of record. 1999 and 1998 were both dry years and the 2000 cumulative flow volumes were close to average. This indicates that dry muskeg areas observed in 1998 and 1999 may have recharged.

**APPENDIX IX**

**UPDATED CLIMATIC AND HYDROLOGIC DATABASE**

The database CD included in this appendix contains data from local monitoring programs and regional data collected by the Meteorologic Service Canada (MSC) and Water Survey of Canada (WSC). A digital copy of this report is also provided on the CD. The data included in the database CD were discussed in Section 6 of this report. The following table shows the directory structure of the database CD.
